DEPARTMENT OF
ELECTRONICS AND COMMUNICATION ENGINEERING

Course Structure
&
Detailed Syllabus

For the students admitted to

B. Tech. Regular Four Year Degree Programme from the Academic Year 2026-27

and

B. Tech. Lateral Entry Scheme from the Academic Year 2027-28

ADITYA COLLEGE OF ENGINEERING, MADANAPALLE

(UGC - Autonomous Institution & Accredited with NAAC A+ Grade)

Approved by AICTE, New Delhi & Affiliated to JNTUA, Anantapuramu

Madanapalle - 517325, Annamayya (Dist.), A. P.

ACEM - R26 REGULATION

ELECTRONICS AND COMMUNICATION ENGINEERING

COURSE STRUCTURE AND SYLLABUS

for

B. Tech. (Regular – Full Time)

(Effective for the Students Admitted into I Year from the Academic Year 2026 - 27 onwards)

and

B. Tech. (Lateral Entry Scheme)

(Effective for the Students getting Admitted into II Year through Later Entry Scheme from the Academic Year 2027 - 28 onwards)

ADITYA COLLEGE OF ENGINEERING :: MADANAPALLE
Punganur Road, Valasapalle (Post), Madanapalle, Annamayya (Dist.,) – 517325.
(An Autonomous Institution)
Department of Electronics and Communication Engineering

Institute Vision:

To impart quality in engineering education to meet the technological advances and industrial requirements with global standards.

Institute Mission:

- Provide quality technical education through skill-based trainings and promote research and development, and consultancy services.
- Offer state-of-the-art-infrastructure for supporting technological advances.
- Develop disciplined, creative and globally competent engineers.
- Equip and empower the faculty at all levels to promote innovations and technical advancements in various domains of engineering.

Department Vision:

To design centre for excellence in the field of revolutionary electronic developments and the future communication to create quality engineers through innovation and impact professional ethics with a good teamwork to fulfil the social needs.

Department Mission:

- Creating graduates with technical expertise, professional, attitude and ethical values by establishing top notch learning environment.
- Inculcating creative thoughts through innovative and team work-based methods to develop entrepreneurship skills and employability among professionals.
- Strengthening soft skills to rural students through co-curricular and extracurricular activities to face industrial challenges.

Programme Outcomes (POs):

On Successful completion, the graduate will be able to,

- **PO1_Engineering Knowledge:** Apply knowledge of mathematics, natural sciences, engineering fundamentals, and an engineering specialization to a wide range of practical procedures and practices.
- **PO2_Problem Analysis:** Identify and analyse well-defined engineering problems and reach substantiated conclusions using codified methods of analysis specific to their field of activity.
- **PO3_Design/Development of Solutions:** Design solutions for well-defined technical problems and assist in the design of systems, components, or processes to meet specified needs, with appropriate consideration for public health and safety, as well as cultural, societal, and environmental factors.
- **PO4_Conduct Investigations of Complex Problems:** Conduct investigations of well-defined problems by locating and searching relevant codes and catalogues, and by conducting standard tests and measurements.
- **PO5_Engineering Tool Usage:** Apply appropriate techniques, resources, and modern computing, engineering and IT tools to well-defined engineering problems, while being aware of their limitations.

- **PO6_The Engineer and the World:** When solving well-defined engineering problems, evaluate sustainable development impacts to society, the economy, sustainability, health and safety, legal frameworks, and the environment.
- **PO7_Ethics:** Understand and commit to professional ethics and the norms of technician practice, including compliance with relevant laws. Demonstrate an understanding of the need for diversity and inclusion.
- **PO8_Individual and Collaborative Team Work:** Function effectively as an individual, and as a member or leader in diverse and inclusive teams, in multidisciplinary face-to-face/remote/distributed settings.
- **PO9_Communication:** Communicate effectively and inclusively on well-defined engineering activities with the engineering community and society at large by comprehending the work of others, documenting one's own work, and giving and receiving clear instructions.
- **PO10_Project Management and Finance:** Demonstrate awareness of engineering management principles as a member or leader of a technical team and apply them to manage projects in multidisciplinary environments.
- **PO11_Life-Long Learning:** Recognize the need for, and have the ability for, independent updating in the face of specialized technical knowledge.

Program Specific Outcomes (PSOs):

On Successful completion, the graduate (Electronics and Communication Engineering) will be able to,

- **PSO1:** Able to identify, formulate, analyse, and solve problems and apply them to analog and digital electronics, communication, signal processing, VLSI systems, embedded systems, IoT, and other multidisciplinary domains.
- **PSO2:** Ability to understand Electronics and Communication Engineering changes and future trends and apply them to electronic system design using hardware, software, and electronic design automation tools.

Programme Educational Objectives (PEOs):

After few years of graduation, the graduates of Electronics and Communication Engineering are expected to

- **PEO1:** To be equipped with skills for solving complex real-world problems related to VLSI, Embedded Systems, Signal/Image processing, and Digital and Wireless Communication.
- **PEO2:** To communicate effectively, work collaboratively and exhibit high levels of professionalism, moral and ethical responsibility.
- **PEO3:** To develop professional skills that will equip them to succeed in their careers and encourage lifelong learning in advanced areas of Electronics and Communications and related fields.
- **PEO4:** To develop the ability to understand and analyze engineering issues in a broader perspective with ethical responsibility towards sustainable development.

B.Tech. – Electronics and Communication Engineering

B.Tech. – I Year

I Semester

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26BSHB101T	BS	**Linear Algebra & Calculus** (Common to all branches of Engineering)	3	0	2	0	4

Pre-Requisites: Basic algebra, trigonometry, coordinate geometry, differential and integral calculus, vectors, matrices, determinants, and functions of several variables.

Course Objectives:

- To build strong foundations in linear algebra and multivariable calculus with direct engineering relevance.
- To integrate analytical methods with AI-assisted computational tools for visualization, simulation, and verification.
- To develop outcome-oriented problem-solving skills aligned with NEP 2020 and modern engineering applications.
- To apply matrix methods, eigenanalysis, and multivariable calculus to solve engineering problems.
- To use computational tools for approximation, optimization, differentiation, and integration.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply matrix algebra techniques to solve systems of linear equations and analyze matrix properties relevant to engineering models. (L3)

CO2: Analyze eigenvalue problems, diagonalization, and quadratic forms to interpret linear transformations and engineering systems. (L4)

CO3: Apply mean value theorems, Taylor and Maclaurin series, and curvature concepts to approximate and interpret engineering functions. (L3)

CO4: Analyze multivariable functions using partial derivatives, Jacobians, gradients, and optimization techniques. (L4)

CO5: Evaluate areas, volumes, and coordinate transformations using multiple integrals in engineering contexts. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	1		1				2	2	1
CO2	3	3	3	2	1		1				2	2	2
CO3	3	2	2	2	1		1				2	1	1
CO4	3	3	3	3	2		1				2	2	2
CO5	3	3	2	3	3		1				2	1	1

Unit I: Matrix Algebra and Linear Systems:

Core Content: Matrices, operations, transpose, inverse, types of matrices, symmetric and skew-symmetric matrices; orthogonal, Hermitian, skew-Hermitian and unitary matrices. determinant properties; rank of a matrix; echelon and normal forms; system of linear equations; consistency conditions; Gauss elimination and Gauss-Jordan methods; iterative methods: Jacobi and Gauss-Seidel;

AI Integration: Python-based solution of large linear systems using NumPy; visualization of convergence in iterative methods; AI-assisted debugging of matrix algorithms; using ChatGPT/Copilot to explain row operations and rank reduction.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; SymPy for symbolic matrix operations; Jupyter Notebook; Scilab.

Unit II: Eigenvalues, Eigenvectors, Diagonalization & Quadratic Forms:

Core Content: Eigenvalues and eigenvectors; Properties, characteristic equation; Cayley-Hamilton theorem; diagonalization; similarity transformation; powers and inverse of matrices using Cayley-Hamilton theorem; quadratic forms; canonical form; reduction by orthogonal transformation; rank, index, signature; Nature of Quadratic form;

AI Integration: AI-assisted eigenvalue computation and verification; Python/SciPy visualization of eigen modes and quadratic surfaces; use of AI tools to explain diagonalization and matrix classification; numerical checking of Cayley-Hamilton theorem.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib); SymPy; GNU Octave; Google Colab.

Unit III: Single Variable Calculus and Series Expansions:

Core Content: Rolle's theorem; Lagrange's mean value theorem; Cauchy's mean value theorem; Taylor's and Maclaurin's series with remainder; approximation of functions; error estimation; curvature of plane curves; radius and centre of curvature; circle of curvature; applications to engineering approximations and curve design.

AI Integration: SymPy-based Taylor and Maclaurin expansion generation; plotting truncation error and convergence; AI-supported derivation checking for mean value theorems; curvature plot visualization and interpretation.

Free/Open-Source AI Tools: Python (SymPy, NumPy, Matplotlib); Google Colab; Jupyter Notebook; WolframAlpha free tier for verification.

Unit IV: Multivariable Differentiation and Optimization:

Core Content: Functions of several variables; limits and continuity; partial derivatives; higher order partial derivatives; total derivative; chain rule; gradient; tangent plane and normal line; Jacobians; functional dependence; Taylor expansion of two-variable functions; maxima and minima; second derivative test; Lagrange multipliers and constrained optimization; divergence and curl.

AI Integration: Gradient field visualization using Python; AI-assisted Jacobian computation and verification; constrained optimization using SciPy; use of AI tools to interpret saddle points, extrema, and optimization constraints.

Free/Open-Source AI Tools: Python (NumPy, SciPy, SymPy, Matplotlib); Google Colab; Jupyter Notebook; SciPy optimize module.

Unit V: Multiple Integrals and Coordinate Transformations:

Core Content: Double integrals; evaluation over type I and type II regions; change of order of integration; triple integrals; change of variables; polar, cylindrical and spherical coordinates; area and volume computation; mass, centroid and moment calculations; engineering applications of multiple integration.

AI Integration: Numerical evaluation of double and triple integrals using SciPy; 2D and 3D region visualization; AI-assisted generation of integration code; interpreting Jacobian as geometric scaling factor in transformed coordinates.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib); Google Colab; SymPy; Jupyter Notebook; 3D plotting tools.

6. SciPy Documentation: https://docs.scipy.org
7. NumPy Documentation: https://numpy.org/doc

Recommended Free & Open-Source AI/Computational Tools:

1. Python (NumPy, SciPy, Matplotlib) – FREE on Google Colab for matrix computation, visualization, and numerical analysis.
2. SymPy (free, open-source) – For symbolic algebra, calculus, matrix operations, and verification.
3. scikit-learn (free, open-source) – For regression, classification, and exploratory predictive modeling.
4. Jupyter Notebook (free, open-source) – For interactive computation and lab documentation.
5. OpenCV (free, open-source) – For image-based experimentation and visualization support where needed.
6. GNU Octave (free, open-source) – MATLAB-like numerical computing for matrix and calculus workflows.
7. TensorFlow / Keras (free, open-source) – For optional AI demonstrations in regression and classification tasks.

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26BSHB105T	BS	Physics for Communication Systems	2	1	0	0	3

Pre-Requisites: Engineering Mathematics, Basic Electronics, and Electromagnetic Theory Fundamentals.

Course Objectives:

- To provide knowledge on wave optics concepts such as interference, diffraction, and polarization with basic AI-assisted optical analysis applications.
- To introduce lasers, fiber optics, and advanced sensing technologies with simple AI-assisted communication and signal processing techniques.
- To equip students the fundamentals of quantum mechanics and quantum computing with basic AI-assisted secure communication concepts.
- To familiarize students with electrical properties of metals and semiconductors using AI-assisted material and conductivity analysis methods.
- To impart knowledge on electromagnetic field theory and its applications with basic AI-assisted antenna and RFID system concepts.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply the principles of interference, diffraction, polarization, along with basic AI-assisted optical analysis in engineering applications. (L3)

CO2: Analyze the working of lasers, fiber optics, and advanced sensing systems along with basic AI-assisted optical communication and signal processing techniques. (L4)

CO3: Apply the concepts of quantum mechanics and quantum computing along with basic AI-assisted secure communication applications. (L3)

CO4: Analyze the electrical properties of metals and semiconductors, along with basic AI-assisted material characterization and conductivity analysis methods. (L4)

CO5: Apply Maxwell's equations and electromagnetic field concepts along with AI-assisted RFID and antenna-based systems. (L4)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	3		1				2	2	1
CO2	3	3	2	2	3		1				2	2	2
CO3	3	3	2	2	2		1				2	2	2
CO4	3	3	3	2	3		1				2	2	2
CO5	3	3	2	3	3		1				2	2	2

Unit I: Wave Optics and Quantum Information Processing:

Core Content: Interference: Principle of superposition and coherence, Interference, Types of interference, Interference in thin films (reflection geometry) and Newton's rings. Applications: Determination of wavelength and refractive index.

Diffraction: Introduction to diffraction, Fresnel and Fraunhofer diffraction, Fraunhofer diffraction due to single, double and N-slits (Diffraction Grating), Dispersive power and Resolving power of grating. Applications: CD/DVD data storage, Barcode scanners.

Polarization: Types of polarization, Nicol's prism, Half-wave and Quarter-wave plates.

AI Integration: AI-assisted polarization management for quantum key distribution. AI-integrated holographic interferometry for surface flatness analysis.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib and scikit-learn).

Unit II: Quantum Photonics and Advanced Sensing:

Core Content: Lasers: Interaction of radiation with matter, Requisites and conditions for laser action, He-Ne laser, Nd-YAG laser, LiDAR basics. Laser-based data communication, Free-space optical communication, Optical data storage, Photonic computing basics, Applications of lasers.

Fiber Optics: Propagation mechanism, Numerical aperture, Acceptance angle, Types of optical fibres, Classifications and Modes of optical fibres, Attenuation and Losses in optical fibers, V- Number - Distributed Fiber Optic Sensing (DFOS) with AI-Powered Signal Analysis.

AI Integration: AI-powered signal analysis for distributed fiber optic sensing. Python simulation of laser propagation and fiber optic signal attenuation.

Free/Open-Source AI Tools: Google Colab, Python, NumPy, SciPy and Scikit-learn/ TensorFlow.

Unit III: Introduction to Quantum Mechanics & Quantum Computing:

Core Content: Introduction to quantum mechanics, de-Broglie concept (matter waves), Heisenberg's Uncertainty Principle, Wave function, Postulates of Quantum Mechanics, Schrödinger's time-independent wave equation, Particle in a one-dimensional potential well, Quantum tunnelling (basic idea).

Introduction to Quantum Computing: Classical bits vs Qubits. Concept of superposition and Entanglement, Basic Quantum Operations: Hadamard gate (idea of superposition), Pauli-X gate. Basic idea of quantum measurement. Applications (qualitative only): AI-Assisted Tunnel Diodes and cold emission of electrons, Basic idea of quantum cryptography and secure communication.

AI Integration: AI-Assisted Analysis of Tunnel Diode Characteristics using Quantum Tunnelling Concepts, AI-Assisted Quantum Key Distribution for Secure Communication

Free/Open-Source AI Tools: Google Colab, Python and Scikit-learn.

Unit IV: Electrical Properties of Metals and Semiconductors:

Core Content: Classical free electron theory – merits and demerits; Quantum free electron theory – equation for electrical conductivity, Fermi-Dirac statistics, Fermi level and variation with temperature, Classification of solids – metals, insulators and semiconductors.

Semiconductors: Introduction, Fermi energy and Fermi level in intrinsic and extrinsic semiconductors, Expression for concentration of electrons in conduction band and holes in valence band, Electrical conductivity, Expressions for drift and diffusion currents, Hall effect, Expression for Hall coefficient and its applications

AI Integration: AI-Assisted Prediction of Electrical Conductivity in Metals and Semiconductors, AI-Assisted Carrier Concentration and Conductivity Analysis in Semiconductors.

Free/Open-Source AI Tools: Google Colab, Python and Scikit-learn.

Unit V: Introduction to EM Theory:

Core Content: Introduction, wave equation in differential form in free space, Vector analysis, Divergence and curl of electric field and magnetic field (static), Gauss' divergence theorem and Stokes' theorem. Derivations of the four Maxwell equations and their significance. Maxwell's equations in vacuum, Energy transport and Poynting Vector. Applications: Radio Frequency Identification (RFIDs) and Antennas.

AI Integration: AI-Assisted RFID-Based Smart Tracking and Identification Systems, AI-Assisted Fault Detection in Antenna Systems,

Free/Open-Source AI Tools: Google Colab, Python and Scikit-learn.

Text Books:

1. Avadhanulu, Kshirsagar&Arun Murthy, A Textbook of Engineering Physics, S. Chand, 2019.
2. D. K. Bhattacharya & Poonam Tandon, Engineering Physics, Oxford Press, 2015.

3. HyperPhysics – hyperphysics.phy-astr.gsu.edu
4. Feynman Lectures – feynmanlectures.caltech.edu
5. PhET Simulations – phet.colorado.edu

Recommended Free & Open-Source AI/Computational Tools:

1. Python (NumPy, SciPy, OpenCV, Matplotlib) – FREE on Google Colab for optics and EM simulations
2. IBM Qiskit (free, open-source) – For quantum computing and quantum cryptography simulations
3. scikit-learn (free, open-source) – For semiconductor data analysis and signal classification
4. OpenEMS (free, open-source) – For electromagnetic field simulation and antenna design
5. PhET Interactive Simulations (free) – For wave optics, semiconductors and quantum phenomena.

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES03101T	ES	Engineering Graphics (Common to all branches of Engineering)	1	0	4	0	3

Pre-Requisites: Basic Geometry, and Fundamental Python Programming.

Course Objectives:

- To familiarise with the BIS conventions, geometric construction standards, and engineering scales.
- To develop visualization skills to interpret and project points, lines, and regular planes into 2D drawing sheets.
- To impart foundational knowledge on projecting regular 3D solids and reading directional geometric orientations.
- To enable the spatial reconstruction of sliced solids and flat unfolded developments of various structural shells.
- To introduce CAD tools combined with generative AI software to construct multi-view isometric representations from 3D models.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Construct engineering curves and scales using traditional drafting geometry validated by automated algorithmic paths. (L3)

CO2: Solve multi-planar projection instances of linear points, segments, and standard regular planar silhouettes. (L3)

CO3: Render projections of standard 3D solids and identify variations using structural boundary algorithms. (L4)

CO4: Draft complex cross-sectional geometries and mapped surface extensions of sliced geometric forms. (L4)

CO5: Produce composite isometric layouts alongside generative text-to-CAD system alternatives for dynamic prototyping. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	2	1			2	1				1	1	1
CO2	3	3	2			2	1				1	1	1
CO3	3	3	2	1		2	1				1	1	2
CO4	3	3	3	1	2	2	1				2	2	2
CO5	3	2	2		3	2	1				2	2	2

Unit 1: Introduction to Engineering Graphics, Curves, and Scales:

Core Content:

Introduction: Principles of Engineering Graphics, signboards, BIS conventions, and lettering.

Curves: Construction of Polygons. Conic sections: Ellipse, Parabola, and Hyperbola using eccentricity/general methods. Cycloidal curves and Involutes.

Scales: Plain, Diagonal, and Vernier scales.

Hands-on Experience: Manual draft generation of an ellipse and diagonal scale, paired with a software verification loop.

AI Integration Module: AI prompt engineering for generating geometric profiles; algorithmic generation of conic curves using mathematical code blocks; parsing hand-drawn geometric sketches into clean vector shapes using Computer Vision (CV) edge detection (Canny Edge/Hough Transform).

Unit II: Orthographic Projections of Points, Lines:

Core Content: Principles of orthographic projections, projection of points in all four quadrants. Projection of straight lines inclined to one or both reference planes, traces of lines, determination of true lengths and true inclinations.

Projections of Planes: regular planes Perpendicular to both reference planes, parallel to one reference plane and inclined to the other reference plane; plane inclined to both the reference planes.

Hands-On Experience & Application:

Project: Construct a transformation script where a user inputting 2D projection endpoint automatically outputs the 3D line representation, true spatial length, and inclination angles without manual geometric tracking.

Application: Calibration setups for stereoscopic robotic arms tracking trajectories across multiple camera planes.

AI Integration Module: Machine learning pipelines for 3D coordinate estimation from 2D views; multi-view structural tracking; training neural models to predict true line length and orientation angles based solely on coordinate projections.

Unit III: Projection of Regular Solids:

Core Content:

Projection of Regular Solids: Types of solids: Polyhedra and Solids of revolution. Projections of solids in simple positions: Axis perpendicular to horizontal plane, Axis perpendicular to vertical plane and Axis parallel to both the reference planes, Projection of Solids with axis inclined to one reference plane and parallel to another plane.

Hands-On Experience & Application:

Project: Set up a classification notebook using scikit-learn or a simple convolutional model to automatically identify the type of solid (e.g., hexagonal prism vs. cone) present within an orthographic engineering layout image.

Application: Automated component sorting inside factory staging bays and conveyor streams.

AI Integration Module: Object recognition models (e.g., YOLO / Mobile Net) trained to identify standard solid geometries; automated multi view projection generation from 3D CAD meshes using programmatic render layers.

Unit IV: Sections of Solids, Development of Surfaces, and AI Generative Design:

Core Content:

Sections of Solids: Perpendicular and inclined section planes, Sectional views and True shape of section, Sections of solids in simple position only.

Development of Surfaces: Methods of Development: Parallel line development and radial line development. Development of a cube, prism, cylinder, pyramid and cone.

Hands-On Experience & Application:

Project: Use a nesting optimization script (e.g., using genetic algorithms or standard heuristics) to arrange several custom flat-surface solid developments onto a finite raw sheet grid, actively minimizing material margins and cut lines.

Application: Sheet metal stamping pattern automation in automotive and aerospace chassis manufacturing.

AI Integration Module: Generative Adversarial Networks (GANs) for generating flat-pattern configurations; algorithmic optimization of surface layouts to minimize sheet manufacturing scrap; predictive toolpath generation using physics-guided heuristic networks.

Unit V: Isometric Projections, Conversions, and 2D-to-3D Deep Reconstruction:

Core Content: Principles of isometric projection, isometric scale, isometric views/projections of planes, simple and compound solids. Conversion of isometric views to orthographic views and vice-versa.

Computer Graphics: Creating 2D&3D drawings of objects including PCB and Transformations using Auto CAD (Not for end examination).

Hands-On Experience & Application:

Project: Use a pretrained depth estimation or pixel-to-voxel neural model to parse a set of front, top, and side drawings, compiling them directly into an interactive 3D point cloud or boundary surface rendering.

Application: Instantly generating 3D printable mechanical files directly from archival 2D layout drafting logs.

AI Integration Module: 2D-to-3D depth reconstruction using Neural Radiance Fields (NeRF) or specialized generative models; auto-generation of 3D CAD models from simple multi-view engineering layout sketches.

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES05101T	ES	Computational Thinking & Problem Solving with Python (Common to all branches of Engineering)	3	0	0	0	3

Pre-Requisites: Basic knowledge of computer fundamentals, logical reasoning, problem-solving, and elementary mathematics.

Course Objectives:

- To introduce students to computational thinking and problem-solving techniques.
- To develop the ability to design algorithms, flowcharts, and pseudocode.
- To provide foundational knowledge of Python programming — data types, operators, and I/O.
- To enable students to implement logic using control structures and data structures.
- To develop skills in modular programming, file handling, and basic OOP concepts.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply computational thinking concepts to design algorithms, flowcharts, and basic Python programs. (L3)

CO2: Develop programs using decision-making and looping constructs to solve logical problems. (L3)

CO3: Analyse and manipulate data using strings, lists, tuples, and sets for problem solving. (L4)

CO4: Design modular programs using functions, recursion, and dictionaries to improve code reusability. (L4)

CO5: Implement file handling, exception handling, and basic object-oriented programming concepts in Python applications. (L3)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	3		1				2	2	1
CO2	3	3	3	2	3		1				2	2	2
CO3	3	3	3	2	3		1				2	2	2
CO4	3	3	3	2	3		1				3	2	2
CO5	3	3	2	3	3		1				3	2	2

Unit I: Computational Thinking and Programming Basics:

Computational Thinking: Characteristics, problem-solving strategies, steps in problem solving; algorithms — definition and properties; flowcharts — symbols and construction; pseudocode — writing and conversion; abstraction, decomposition, pattern recognition, algorithm efficiency basics.

Introduction to Python: Installation and execution environment; variables, identifiers, keywords; data types, type conversion; input and output statements; expressions and operators — arithmetic, relational, logical, assignment; operator precedence.

AI Tools Integration: Use Flowgorithm to design and simulate algorithms (e.g., largest of 3 numbers); draw flowcharts using Lucidchart; use Algorithm Visualizer to trace algorithm execution; use ChatGPT to convert pseudocode to Python and verify output.

Unit II: Decision Making and Looping:

Decision Control Statements: Boolean expressions; if, if-else, if-elif-else, nested if; conditional expressions (ternary operator).

Looping Statements: while loop, for loop, iteration techniques, nested loops, infinite loops; loop control — break, continue, pass; else with loops.

Practical Problem Solving: Prime number check, pattern programs using nested loops, menu-driven programs using control statements.

AI Tools Integration: Use Python Tutor to visualize if-else and loop execution step by step; use Thonny to debug loop-based programs; use Replit for online coding practice; use ChatGPT to generate test cases for control flow programs.

Unit III: Strings and Data Structures:

Strings: Representation, indexing, slicing, operations, built-in functions and methods.

Lists: Creation, indexing and slicing, operations, functions, methods, nested lists.

Tuples: Creation, operations, packing and unpacking.

Sets: Creation, set operations — union, intersection, difference; frozen sets.

AI Tools Integration: Use NLTK and TextBlob to perform text analysis (sentiment, word frequency) on strings; use Pandas and NumPy for list and array operations; use ChatGPT to explain string slicing and list comprehensions with concrete examples.

Unit IV: Functions and Problem Solving:

Dictionaries: Creation, operations, methods; dictionary-based applications.

Functions: Built-in and user-defined functions; function definition and calling; arguments — positional, keyword, default, variable-length; scope of variables (local and global).

Recursion: Recursive functions — factorial, Fibonacci; lambda functions (anonymous functions); applications of functions in problem solving.

AI Tools Integration: Use Jupyter Notebook for interactive function experiments; use SymPy for symbolic mathematical expressions; use PyCharm for modular program development; use ChatGPT to trace recursive function calls step by step.

Unit V: File Handling, Exception Handling, and OOP:

Modules and Packages: Creating and importing modules; standard library modules.

File Handling: Opening, reading, writing, and closing files; file modes; working with text files; processing CSV and Excel files.

Exception Handling: Types of errors (syntax, runtime, logical); try, except, finally blocks; raising exceptions.

Introduction to OOP: Classes, objects, attributes, methods, constructors, self-keyword; basic applications of OOP in Python.

AI Tools Integration: Use Pandas and OpenPyXL to read and write CSV/Excel files; use Pytest for testing exception handling; use ChatGPT to explain OOP class design with real-world examples; use Django for a simple mini web application as a capstone project.

Text Books:

1. Pieter Spronck, Computational Thinking with Python, (course textbook — covers computational thinking, algorithms, and Python programming).
2. Reema Thareja, Programming in Python, Oxford University Press. (Primary implementation reference — all five units.)

2. Eric Matthes, Python Crash Course, 2nd Edition, No Starch Press.

Online Tools used in this Course:

1. Algorithm & Flowchart: Flowgorithm – flowgorithm.org |Lucidchart – lucidchart.com | Algorithm Visualizer – algorithm-visualizer.org
2. Programming & Debugging: Python Tutor – pythontutor.com | Thonny – thonny.org |Replit – replit.com
3. Data & Scientific: Pandas – pandas.pydata.org | NumPy – numpy.org |SymPy – sympy.org
4. NLP & Text: NLTK – nltk.org |TextBlob – textblob.readthedocs.io
5. Development: Jupyter Notebook – jupyter.org | PyCharm – jetbrains.com/pycharm |OpenPyXL – openpyxl.readthedocs.io
6. NPTEL – Problem Solving through Programming in C / Python – nptel.ac.in

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES31101T	ES	AI Tools and Applications (Common to all branches of Engineering)	1	0	4	0	3

Pre-Requisites: Basic computer literacy, internet usage, information-search skills, and fundamental communication and problem-solving skills.

Course Objectives:

- To introduce students to AI concepts and the landscape of AI tools available for everyday academic and professional use.
- To develop practical skills in using AI for document creation, presentations, writing, and academic tasks applicable across all engineering disciplines.
- To build proficiency in AI-powered data analysis, spreadsheet automation, and intelligent research tools without requiring programming knowledge.
- To expose students to AI tools in visual design, media creation, and note-taking, and progressively to AI applications specific to their engineering branch.
- To cultivate responsible AI habits: verifying outputs, protecting privacy, respecting intellectual property, and understanding ethical and legal boundaries of AI use.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply the fundamental concepts of Artificial Intelligence (AI) to explain its working principles and demonstrate the use of AI tools across text, image, audio, video, and code applications. (L3)

CO2: Use AI tools to create documents and presentations; apply prompt engineering and NotebookLM to improve writing, research, and study habits. (L4)

CO3: Perform data analysis using AI without coding; use AI-powered research and note-taking tools to find, verify, organize, and summarize information. (L4)

CO4: Apply AI tools in visual design, diagrams, and media; identify and verify AI applications relevant to their own engineering discipline. (L3)

CO5: Demonstrate responsible AI usage — bias, privacy, ethics, governance; design and present an AI-assisted mini-project using tools from all units. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	2	2	1	3	2	1				1	2	2
CO2	3	3	2	2	3	1	1				1	1	2
CO3	3	2	3	2	3	1	1				1	2	2
CO4	3	3	3	3	3	2	1				2	2	2
CO5	3	2	2	2	3	2	1				2	2	2

Unit I: Understanding AI and AI for Documents and Presentations:

What is AI: AI vs. ML vs. Deep Learning vs. Generative AI; brief history (Turing Test → ChatGPT → generative AI era); how LLMs work (training data, next-token prediction, temperature, hallucinations, context windows, knowledge cutoffs). AI ecosystem: ChatGPT, Claude, Gemini, Microsoft Copilot — strengths and differences.

AI for Presentations: Gamma.app — full slide deck from a paragraph prompt; Microsoft Copilot in PowerPoint — slide generation, design suggestions, speaker notes; Canva AI — Magic Design, text-to-presentation, brand kits; Beautiful.ai — smart slide layouts; comparing AI-generated vs. manually created presentations.

AI for Document Writing: Microsoft Copilot in Word — draft, rewrite, summarize; Gemini in Google Docs — writing assistance and inline Q&A; Notion AI — meeting notes, project plans, knowledge base; Claude Projects — organizing documents and having a persistent AI assistant over a set of files.

AI Writing Assistance: Grammarly — grammar, tone, clarity, plagiarism; ChatGPT and Claude for lab reports, proposals, and letters; academic integrity — AI as an assistant not an author; disclosure norms; identifying AI-generated content using GPTZero.

AI Integration: Use Gamma.app to generate a presentation on an engineering topic in under 2 minutes; use Copilot in Word or Gemini in Docs to draft and improve a report; compare ChatGPT, Claude, Gemini, and Microsoft Copilot on the same writing task; use Grammarly to review your own writing.

Unit II: AI For Research, Note-Taking, Data, and Spreadsheets:

NotebookLM (Google): uploading lecture notes, textbooks, PDFs, and research papers as sources; asking questions grounded in uploaded documents; generating study guides, timelines, briefing documents, and audio overviews (podcast-style summaries) from sources; source-grounded answers that cite the exact passage — eliminating hallucination risk.

AI for Research: Perplexity AI (real-time web search with citations), Gemini Deep Research (multi-step research reports), Elicit and Consensus (academic paper search with evidence summaries); verifying AI-generated citations on Google Scholar; why AI fabricates references and how to detect it.

Prompt Engineering: zero-shot, one-shot, few-shot, chain-of-thought, role-based prompting; iterative refinement; negative prompting; building effective prompts for summarization, comparison, explanation, and data extraction; using ChatGPT custom instructions and Claude Projects for persistent context.

AI for Spreadsheets and Data Analysis: Microsoft Copilot in Excel — VLOOKUP, IF, COUNTIF, pivot tables from natural language; Gemini in Google Sheets — formula generation and chart creation; ChatGPT Advanced Data Analysis and Julius AI — uploading CSV files, computing statistics, generating charts, interpreting patterns — no coding required.

AI Integration: Upload your own lecture notes to NotebookLM and generate a study guide and audio overview; use Perplexity AI and Gemini Deep Research to research a topic; verify citations on Google Scholar; use Wolfram Alpha or Symbolab to solve and verify equations from your current semester subjects; use Copilot in Excel or ChatGPT ADA to analyse a real dataset.

Unit III: AI for Visual Design, Diagrams, and Media:

AI for Image Generation: DALL-E 3 (via ChatGPT), Canva AI (text-to-image, Magic Design, background remover), Adobe Firefly, Ideogram — writing effective image prompts (style, subject, composition, colour); iterative prompt refinement for posters, diagrams, and mockups.

AI for Diagrams and Visual Thinking: Napkin.ai — converting text or concepts into visual diagrams, charts, and infographics automatically; Whimsical AI — AI-generated mind maps, flowcharts, and wireframes from a description; Miro AI — collaborative whiteboard with AI summarization and diagramming.

AI for Audio and Video: ElevenLabs — text-to-speech and voice cloning for presentations and voiceovers; Suno and Udio — AI music generation for project videos; Runway and Pika — generating short video clips from text prompts; HeyGen — AI avatars for video presentations; current limitations and appropriate use cases.

AI Content Detection and Critical Evaluation: GPTZero, Originality.ai for AI-text detection; Google Lens and reverse image search for AI-generated images; fact-checking workflows — cross-referencing primary sources; deepfakes and synthetic media — recognition, risks, and responsible creation.

AI Integration: Use Napkin.ai to convert a paragraph of text into a diagram; use Whimsical AI to generate a mind map of a course topic; use DALL-E 3 or Canva AI to create an event poster through 3 prompt iterations; use ElevenLabs to create a voiceover; test GPTZero on 5 samples and analyse confidence scores.

Unit IV: AI Across Engineering Disciplines:

AI in Mechanical Engineering: generative design in CAD (Autodesk Fusion 360 — AI-optimized structures for weight and load); predictive maintenance using sensor data and ML; AI-assisted FEA simulation; manufacturing process optimization; digital twins.

AI in Civil and Electrical Engineering: structural health monitoring using ML; smart grid load forecasting and energy management; AI for circuit simulation and PCB layout optimization (Altium AI); VLSI design automation — floor planning and routing; power systems fault detection.

AI in Electronics and Communication: AI-assisted signal processing and filtering; speech recognition for embedded systems; computer vision for industrial quality inspection; AI in antenna design and spectrum management; MATLAB AI and Deep Learning Toolbox.

AI in Computer Science and allied branches: GitHub Copilot for code generation, explanation, and review; AI-powered testing (Testim, Selenium AI); AI in cybersecurity — anomaly detection and intrusion detection; no-code/low-code platforms (Bubble, Glide, Webflow AI); AI for data science (Jupyter AI, DataRobot).

AI Integration: Each student identifies 5 real AI tools in their own engineering branch using Claude or ChatGPT and verifies each using official product pages or research publications; present findings in a 3-minute class presentation with a structured comparison table.

Unit V: Responsible AI, Ethics, and Capstone Project:

AI bias and fairness: sources of bias (data, model, deployment); real documented cases — Amazon hiring algorithm (2018), COMPAS recidivism (2016), facial recognition disparities (NIST 2019); fairness metrics; misinformation, deepfakes, and synthetic media risks.

Privacy and intellectual property: what happens to data entered into public AI tools; PII risks; data retention policies of ChatGPT (OpenAI), Claude (Anthropic), and Gemini (Google); who owns AI-generated content; copyright status globally; academic plagiarism with AI; personal data safety protocol.

AI governance frameworks: EU AI Act risk tiers (unacceptable, high, limited, minimal); UNESCO AI Ethics Recommendation; India's NITI Aayog Responsible AI Guidelines; India Digital Personal Data Protection Act 2023 (DPDP Act); environmental cost of AI — energy and carbon footprint of LLM training and inference.

Capstone Mini-Project: each student (or pair) defines a real engineering problem, selects at least 3 AI tool categories from Units I–IV, produces a quality-verified deliverable (report, presentation, diagram, or automation), and presents in 5 minutes. Evaluation: problem clarity, tool selection, output quality, human refinement, responsible AI disclosure.

AI Integration: Read and compare data retention policies of ChatGPT, Claude, and Gemini; classify 5 daily-use AI systems using EU AI Act risk tiers; use GPTZero and Google Lens to detect AI-generated content; design and present the Capstone Mini-Project integrating tools from all five units.

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26BSHB105P	BS	Physics for Communication Systems Lab	0	0	0	3	1.5

Pre-Requisites: Basic Physics and Mathematics (Class XII level).

Course Objectives:

- To determine optical properties of materials — dispersive power, radius of curvature, and wavelength of light — using prism, Newton's rings, and diffraction grating experiments.
- To investigate quantum and laser phenomena by estimating Planck's constant through the photoelectric effect and measuring laser wavelength using diffraction.
- To study the electrical, magnetic, and semiconductor properties of materials — including B–H curves, Hall effect, energy gap, resistivity, and ferroelectric behaviour.
- To measure electromagnetic quantities such as self-inductance, magnetic field along a coil axis, and Hall voltage using standard instruments and experimental setups.
- To apply Python and AI/LLM tools to automate data analysis, simulate physical phenomena, and validate experimental results through computational methods.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply the fundamental physical principles underlying optical, electromagnetic, and semiconductor phenomena to perform and analyze related laboratory experiments. (L3)

CO2: Conduct experiments to determine optical constants such as dispersive power, wavelength, and radius of curvature. (L3)

CO3: Measure electrical and magnetic properties of materials including resistivity, energy gap, and Hall coefficient. (L3)

CO4: Analyse experimental data, estimate errors, and validate results using Python-based computational tools. (L4)

CO5: Evaluate the agreement between experimental and theoretical values using AI/ML-assisted data analysis. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	3	2		3	3	3		2	2	2
CO2	3	3	2	3	2		3	3	3		2	2	1
CO3	3	3	3	3	2		3	3	3		2	2	2
CO4	3	3	2	3	2		3	3	3		3	2	2
CO5	2	3	2	2	2		3	3	3		3	2	2

List of Experiments:

Part A: Regular Experiments:

1. Determination of the dispersive power of the prism
2. Determination of the thickness of a thin object by the wedge method
3. Determination of the radius of curvature of the lens by Newton's rings
4. Determination of wavelengths of various colours of mercury spectrum using diffraction grating in the normal incidence method
5. Determination of wavelength of a LASER using diffraction grating
6. Estimation of Planck's constant using the photoelectric effect
7. Determination of e/m of an electron by J.J. Thomson method
8. Determination of the Curie temperature and dielectric constant of a ferroelectric material

9. Study the variation of B versus H by magnetizing the magnetic material (B–H curve)
10. Determination of the resistivity of a semiconductor by the four-probe method
11. Determination of the energy gap of a semiconductor using p–n junction diode
12. Determination of Hall voltage and Hall coefficient of a given semiconductor using Hall effect
13. Verification of the inverse square law for a magnetic field using a Hall probe
14. Measurement of self-inductance of a coil using LCR meter and the resonance method
15. Determination of magnetic field along the axis of a current-carrying circular coil by Stewart & Gee's Method

Part B: AI Integration Lab Exercises:

16. Optics Data Automation (Python / Matplotlib): input raw angle-of-deviation data from the prism experiment; fit a polynomial to the deviation vs. angle curve; extract the angle of minimum deviation and compute dispersive power; overlay the fitted curve on experimental data points.
17. Fringe Analysis using OpenCV (Python / Google Colab): import Newton's ring or wedge-fringe images; apply Gaussian blur and Canny edge detection to locate fringe centres; compute fringe diameters automatically; calculate radius of curvature or thickness and compare with manual measurements.
18. Planck's Constant Estimation (Python / NumPy): input stopping potential vs. frequency data from the photoelectric experiment; apply linear regression (V_5 vs. ν); extract slope to compute h and y-intercept to find work function; plot the regression line and quantify percentage error against the accepted value 6.626×10^{-34} J·s.

AI Integration: AI integration adds three exercises after the regular experiments: (i) Python automation of prism deviation curve fitting and dispersive power extraction using Matplotlib/NumPy; (ii) OpenCV-based fringe image analysis for Newton's rings and wedge method — automating diameter measurement and radius of curvature computation; (iii) linear regression on photoelectric effect data to extract Planck's constant and work function — reinforcing the connection between the physical experiment and quantum theory.

Free / Open-Source AI Tools: Python (NumPy, SciPy, OpenCV, Matplotlib) – Google Colab (free); scikit-learn (free) – semiconductor data analysis; PhET Interactive Simulations (free) – wave optics and quantum phenomena; VLabs IIT (free) – online physics experiments.

Recommended Free & Open-Source AI / Computational Tools:

1. Python (NumPy, SciPy, OpenCV, Matplotlib) on Google Colab (free) – optics automation, fringe analysis, photoelectric regression, EM simulations
2. scikit-learn (free, open-source) – semiconductor data analysis and signal classification
3. OpenEMS (free, open-source) – electromagnetic field simulation and antenna design
4. PhET Interactive Simulations (free) – wave optics, semiconductors, and quantum phenomena: phet.colorado.edu
5. Virtual Labs – IIT (free): https://iitb.vlabs.co.in/discipline.html?discipline=Physical_Sciences – online simulation of optics, semiconductor and EM experiments

6. HyperPhysics (free) – concept reference for optics, quantum and EM theory: hyperphysics.phy-astr.gsu.edu
7. LibreOffice Calc (free, open-source) – standardised data recording templates for all experiments

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES05101P	ES	Computational Thinking & Problem Solving with Python Lab (Common to all branches of Engineering)	0	0	0	3	1.5

Pre-Requisites: Basic computer literacy, logical reasoning, problem-solving skills, and elementary mathematics.

Course Objectives:

- To develop problem-solving skills through algorithms, flowcharts, and basic Python programming.
- To enable students to implement decision-making and iterative solutions using Python control structures.
- To develop programming skills for manipulating strings and built-in data structures such as lists, tuples, and sets.
- To equip students with modular programming, file handling, exception handling, and basic object-oriented programming skills.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply algorithms, flowcharts, variables, data types, and operators to design and implement basic Python programs for solving simple computational problems. (L3)

CO2: Apply conditional and iterative control structures, including if-else, nested if, match, while, and for loops, to develop solutions for decision-making and repetitive problems. (L3)

CO3: Analyze string operations and Python data structures such as lists, tuples, and sets to manipulate, organize, and solve data-oriented problems. (L4)

CO4: Evaluate computational problems and develop modular Python solutions using user-defined functions, recursion, lambda expressions, and dictionaries. (L5)

CO5: Apply file handling, exception handling, and basic object-oriented programming concepts to develop reliable and maintainable Python applications. (L3)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	1	3		3	3	3		2	2	1
CO2	3	3	3	2	3		3	3	3		2	2	2
CO3	3	3	3	2	3		3	3	3		2	2	2
CO4	3	3	3	2	3		3	3	3		3	2	2
CO5	3	3	3	3	3		3	3	3		3	2	2

List of Experiments:

Unit I: Computational Thinking and Programming Basics:

1. Algorithm Design, Flowcharts, and Python Basics:

Draw flowcharts using Flowgorithm for three problems: (a) find the largest of two numbers; (b) check whether a number is even or odd; (c) compute the factorial of a given number. For each flowchart, trace through the logic manually with 3 sample inputs before coding. Write equivalent Python programs for all three; run them in Thonny or Google Colab and verify that the output matches the manual trace. Use Python Tutor to visualize the variable state at each step for the factorial program.

2. Data Types, Operators, and Type Conversion:

Write Python programs to: (a) declare variables of all primitive data types (int, float, complex, bool, str) and print their type using type(); (b) demonstrate all operator categories — arithmetic (+, −, ×, ÷, //, %, **), relational (==, !=, <, >, <=, >=), logical (and, or, not), bitwise (&, |, ^, ~, <<, >>), and assignment

operators — with one example each; (c) demonstrate implicit and explicit type conversion — int to float, float to int, int to str, str to int using int(), float(), str(); (d) print a formatted bill: accept item name, quantity, and price as input; compute and display total using f-string formatting with two decimal places.

3. Input, Output, and Expression Evaluation:

Write Python programs to: (a) accept the radius of a circle from the user; compute and display area (πr^2) and circumference (2π r) using the math module; (b) accept three subject marks; compute total, percentage, and grade (O ≥ 90, A+ ≥ 80, A ≥ 70, B+ ≥ 60, B ≥ 50, C ≥ 40, F < 40); print a formatted result card using print() with appropriate spacing; (c) accept two numbers and an operator (+, −, ×, ÷) as input; evaluate the expression using eval(); handle division by zero using a simple if condition; (d) demonstrate operator precedence: compute and print results of 5 mixed expressions — predict the result manually first, then verify by running the program.

Unit II: Decision Making and Looping:

4. Decision Control — if, elif, else, and match:

Write Python programs to: (a) accept a year and check whether it is a leap year using nested if — a year is a leap year if divisible by 400, or divisible by 4 but not by 100; test with 2000, 1900, 2024, 2023; (b) accept a character and classify it as uppercase letter, lowercase letter, digit, or special character using if-elif-else; (c) accept a day number (1–7) and print the day name using match-case (Python 3.10+); add a default case for invalid input; (d) implement a simple ATM menu using nested if — display options (Check Balance, Deposit, Withdraw, Exit); perform the selected operation; display appropriate error messages for invalid PIN or insufficient balance.

5. Loops — while, for, and Nested Loops:

Write Python programs to: (a) print multiplication table of a number entered by the user using a for loop (1 to 10); (b) print all prime numbers between 1 and 100 using a while loop with a flag variable — also count and display the total number of primes found; (c) print the following five patterns using nested for loops: right-angled triangle (stars), inverted triangle, number pyramid, Floyd's triangle, and a diamond pattern — accept the number of rows as input for each; (d) implement a number guessing game — generate a random number between 1 and 50 using random.randint(); allow the user a maximum of 7 attempts; print 'Too High' or 'Too Low' as hints; use break when the correct number is guessed; display attempts used.

6. Loop Control and Application Programs:

Write Python programs to: (a) compute the sum of digits, reverse, and check if palindrome for a number entered by the user — use a while loop extracting digits using % and //; test with 121, 12321, 1234; (b) compute the sum of the Fibonacci series up to N terms using a for loop; also print the series itself; (c) accept a positive integer N and compute: sum of natural numbers ($1+2+\ldots+N$), sum of squares ($1^2+2^2+\ldots+N^2$), and sum of cubes ($1^3+2^3+\ldots+N^3$) — verify sum of cubes formula: $[N(N+1)/2]^2$; (d) implement a simple calculator using a while loop with a menu — loop continues until the user selects Exit; use continue to handle invalid menu choices without breaking the loop.

Unit III: Strings and Data Structures:

7. String Operations and Methods:

Write Python programs to: (a) accept a string and perform: count vowels and consonants, reverse the string, check palindrome, count words, convert to title case — display all results; (b) demonstrate 10 built-in string methods: upper(), lower(), strip(), replace(), split(), join(), find(), count(), startswith(), endswith() — with one practical example each; (c) accept a sentence and: find the longest word, count frequency of each word (store in a dictionary), print words in alphabetical order; (d) implement a simple Caesar cipher — accept a message and a shift value (1–25); encrypt each letter by shifting it; display encrypted message; write a decrypt function to recover the original message.

8. Lists and Tuples:

Write Python programs to: (a) create a list of 10 integers; perform: insert at a given position, delete by value, find maximum and minimum without using built-in max/min, sort using Bubble Sort, search using linear search — display the list after each operation; (b) demonstrate list slicing: extract first half, second half, every alternate element, and reverse using slice notation; compare with string slicing on the same index values; (c) store student records as a list of tuples — each tuple: (roll_no, name, marks); sort by marks (descending) using sorted() with a lambda key; print rank list; find the student with highest marks using max() with a key; (d) demonstrate list comprehension: generate squares of even numbers from 1 to 20; filter words longer than 4 characters from a given word list; create a multiplication table as a 2D list using nested comprehension.

9. Sets and Applications:

Write Python programs to: (a) create two sets A and B from user input; compute and display: union (A | B), intersection (A & B), difference (A − B and B − A), symmetric difference (A ^ B); verify De Morgan's laws: not(A | B) == (not A) & (not B) for sample values; (b) use a set to remove duplicates from a list of 20 student roll numbers (with deliberate duplicates); compare list size before and after; print the unique roll numbers in sorted order using sorted(set()); (c) demonstrate frozen sets: create a frozenset of prime numbers up to 20; attempt to add an element (show TypeError); use it as a dictionary key (demonstrate immutability advantage); (d) implement a program to find: students who passed all three subjects, students who failed at least one, students who passed exactly two — store each class in a set and use set operations.

Unit IV: Functions and Problem Solving:

10. Dictionaries and Applications:

Write Python programs to: (a) create a student marks dictionary {name: [marks_list]}; compute and display average marks, highest scorer, and students who scored below 50; add a new student, update an existing student's marks, delete a student — show the dictionary after each operation; (b) implement a word frequency counter — accept a paragraph as input; split into words; build a frequency dictionary using a for loop; print the top 5 most frequent words sorted by count descending; (c) demonstrate all dictionary methods: keys(), values(), items(), get(), update(), pop(), setdefault(), copy() — with one example each; (d) build a simple phone book — store contacts as {name: phone}; support: add contact, search by name, delete contact, display all contacts sorted alphabetically — use a while loop menu.

11. User-Defined Functions and Scope:

Write Python programs to: (a) write 5 utility functions: is_prime(n), is_palindrome(s), factorial(n), gcd(a,b), power(base, exp) — call each with 3 test inputs and verify results; (b) demonstrate all four argument types: positional (def greet(name, age)), default (def greet(name, age=18)), keyword (greet(age=20, name='Ram')), and variable-length (*args for sum of any count, **kwargs for student info display) — write one function for each and test; (c) demonstrate local vs. global scope: write a program with a global counter variable that is modified inside a function using the global keyword; contrast with a local variable of the same name — print both; (d) write a function find_stats(numbers) that accepts a list and returns mean, median, mode, and standard deviation without using the statistics module — test on [4, 7, 13, 2, 7, 4, 7, 1].

12. Recursion and Lambda Functions:

Write Python programs to: (a) implement recursive functions for: factorial(n), fibonacci(n), sum_of_digits(n), binary_search(arr, target, low, high), and power(base, exp) — for each, use Python Tutor to trace the call stack for a small input and count the total recursive calls; (b) compare iterative vs. recursive factorial for n = 5, 10, 15, 20 on execution time using time.time(); document when recursion becomes slower; (c) implement lambda functions for: square, cube, even/odd check, Celsius-to-Fahrenheit, and concatenate two strings — use each with map() and filter() on a list of 10 elements; (d)

write a higher-order function apply_twice(f, x) that applies function f to x twice; test with square, double, and increment functions; demonstrate that lambda functions work as arguments.

Unit V: File Handling, Exception Handling, and OOP:

13. File Handling:

Write Python programs to: (a) create a text file and write 10 lines of student records (roll number, name, marks); read and display all lines; append 5 more records; count total lines; display only records where marks > 60; (b) copy the contents of one text file to another; count total characters, words, and lines in the source file; find and replace a specific word (e.g., 'Python' → 'programming') and write the result to a new file; (c) read a CSV file (student data) using the csv module; compute average marks per subject; write a summary report CSV with student name and grade; (d) create a student marks file; sort all records by marks in descending order (read all, sort in memory, rewrite); demonstrate the difference between read modes: 'r', 'w', 'a', 'r+' with examples.

14. Exception Handling:

Write Python programs to: (a) write a program that accepts two numbers and performs division; handle ZeroDivisionError, Value Error (non-numeric input), and Type Error in separate except blocks; use a finally block to print 'Operation complete' regardless of outcome; (b) implement a robust file reader that handles File Not Found Error and Permission Error; use try-with multiple except clauses; after handling each exception, print a meaningful user-friendly error message rather than a traceback; (c) define a custom exception class Insufficient Funds Error(Exception) with a message attribute; implement a Bank Account class with deposit() and withdraw() methods — withdraw() raises Insufficient Funds Error if balance is insufficient; test with deposits and withdrawals; (d) demonstrate exception chaining (raise X from Y) — catch a Value Error and re-raise as a custom Application Error with the original exception attached; use raise without arguments in a re-raise scenario.

15. Object-Oriented Programming — Class Design Capstone:

Design and implement a Student Management System using OOP: (a) create a Student class with attributes: roll_no, name, marks (list of 5 subjects) and methods: compute _percentage(), get_grade() (O/A+/A/B+/B/C/F), display() — create 5 Student objects with different data; (b) add a class variable total_students that increments with each object creation; add a class method get_total() and a static method validate_marks(marks) that returns True if all marks are between 0 and 100; (c) demonstrate object interactions: write a find_topper(students) function that accepts a list of Student objects and returns the one with the highest percentage; sort the list of Student objects by percentage using sorted() with a lambda key on obj.compute_percentage(); (d) write all student records to a file using the write() method; read them back and reconstruct Student objects; print the final class report in tabular format using f-strings with column alignment.

AI Tools Integration (Lab): Use Thonny IDE (beginner-friendly, built-in debugger) or Google Colab as the primary lab environment. Use Python Tutor (pythontutor.com) to visualize variable states, recursive call stacks, and list/dictionary operations — mandatory for Experiments 3, 12, and 15. Use Flowgorithm to design flowcharts before writing code in Experiments 1 and 4. Use ChatGPT or Claude to explain error messages when a program fails — read the explanation, fix the error yourself, and document both the error and the fix. Do NOT copy AI-generated code directly; use AI to understand concepts and debug, then write the solution independently.

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES03102P	ES	**Engineering Workshop** (Common to all branches of Engineering)	0	0	0	3	1.5

Pre-Requisites: Basic Computing Elements.

Course Objectives:

- To create awareness on safety precautions required at workplace.
- To master fundamental hand tools and traditional manufacturing craftsmanship.
- To practice on manufacturing of components using workshop trades including fitting, Sheet metal and carpentry, foundry and welding.
- To import basic electrical engineering knowledge for House Wiring Practice.
- To demonstrate fundamentals of foundry and welding.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply appropriate safety precautions and procedures while performing various workshop operations. (L3)

CO2: Analyze the selection, application, and operational capabilities of measuring, marking, and cutting tools used in workshop practices. (L4)

CO3: Evaluate and fabricate precision wood and metal fitting joints according to standard specifications and quality requirements. (L5)

CO4: Analyze wire standards, residential switching arrangements, lighting circuits, and basic electrical appliances to ensure safe and effective operation. (L4)

CO5: Evaluate the suitability and application of tools used in foundry and welding sections for different workshop operations. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	2	2		2	2	3	3	3		2	1	1
CO2	3	2	2		2	2	3	3	3		1	1	1
CO3	3	2	2		1	2	3	3	3		2	1	2
CO4	3	2	2			2	3	3	3		1	2	2
CO5	3	2	2			2	3	3	3		1	1	1

1. Safety Practices & Precautions: Demonstrate the necessity of Workshop hazards, various Personal Protective Equipment and emergency protocols.

AI Integration: Computer vision for safety compliance.

2. Wood working: Introduction to different types of woods, carpentry tools, timber joints

a) Half – Lap joint b) Mortise and Ten on joint c) Corner Dovetail joint or Bridle joint

3. Fitting: Familiarity with different types of tools used in fitting and perform fitting exercises like a) V-fit b) Dovetail fit c) Semi-circular fit

4. Sheet Metal Working: Familiarity with different types of tools used in sheet metal working, Developments of following sheet metal job from GI sheets.

a) Tapered tray b) Conical funnel c) Elbow pipe d) Brazing

5. Electrical wiring: Introduction to electrical tools, safety precautions, wiring materials.

Familiarity with different types of basic electrical circuits and make the following connections.

a) Parallel and series b) Two-way switch c) God own lighting d) Tube light e) Three phase motor f) Soldering of wires

6. Plumbing: Introduction to plumbing tools, pipe fittings, thread cutting, making a simple PVC pipe joint. Preparation of Pipe joints with coupling for same diameter and with reducer for different diameters.

7. Welding Shop: Demonstration and practice on Arc Welding and Gas welding. Preparation of a simple Lap joint/Butt joint.

8. Foundry Trade: Demonstration and practice on Moulding tools and processes, Preparation of Green Sand Moulds for a simple Patterns.

9. Introduction to 3D Printing: Demonstrate the core concepts of 3D printing, Hardware, software, Digital file and 3D printing materials. Familiarise with 3D Printing Process of complex objects.

10. Computer Components: Disassemble and reassemble a desktop computer to understand the role of each component (CPU, motherboard, RAM, HDD/SSD, GPU, etc.).

Hardware Troubleshooting & Peripheral Installation: Simulate common hardware issues (e.g., RAM failure, CPU overheating) and identify the procedures to resolving them.

Peripheral Installation: Install and configure peripheral devices such as printers, scanners, and external hard drives.

Network Setup and Configuration: Set up a small LAN network with routers, switches, and computers. Configure IP addresses, subnet masks, and basic network services.

11. Disassembly and Assembly of equipment such as Bicycle, Gear Box, Braking System: Familiarise with disassembly and assembly process

AI Integration Module: Smart energy monitoring using IoT current sensors; building machine learning load forecasting models; training anomaly detection systems to automatically flag electrical arc or leakage patterns.

Develop predictive load-monitoring models that detect faulty configurations or phantom energy drains.

B. Tech. – I Year I Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26HMHS103L	HM	NSS / NCC / Scouts & Guides / Community Service (Common to all branches of Engineering)	0	0	0	1	0.5

Pre-Requisites: Basic awareness of civic responsibilities, community service, teamwork, discipline, and general social and environmental issues.

Course Objectives:

- To inculcate the spirit of volunteerism, patriotism and social responsibility among students.
- To enable students to understand the structure, objectives and working of NSS, NCC, Scouts & Guides.
- To develop leadership, communication, teamwork and crisis-management skills through experiential learning.
- To equip students with basic first-aid and disaster-preparedness competencies.
- To promote community engagement and sustainable development values through organised service activities.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply the principles and practices of NSS, NCC, Scouts & Guides, and community service to demonstrate responsible citizenship, civic sense, volunteerism, ethical conduct, and active participation in community-development activities. (L3)

CO2: Apply leadership, communication, teamwork, field-craft, camping, disaster-management, and first-aid skills to effectively respond to community, camp, and emergency situations. (L3)

CO3: Apply community needs-assessment, project-planning, social-awareness, environmental-conservation, digital-literacy, and documentation skills to implement and evaluate community service and service-learning activities. (L3)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1						3	2	2	2		2		
CO2						3	3	3	2		2		
CO3						3	2	3	2		2		

Unit I: Foundation of NSS, NCC, Scouts & Guides and Community Service:

- Introduction to NSS – history, objectives, badge, motto, pledge
- Introduction to NCC – ranks, uniforms, aims, NCC Act 1948
- Scouts & Guides – Baden-Powell legacy, Bharat Scouts & Guides Act
- Community Service – concept, importance and types
- Citizenship, civic sense and social responsibility
- Volunteerism: global and Indian perspective (NYKS, NSS, Red Cross)
- Legal & ethical framework for community service

Unit II: **Leadership, Skill Development, Camping and Disaster Management:**

- Leadership development – theories and models (situational, transformational)
- Team building, communication & conflict resolution
- Parade, drill & physical training basics
- Map reading, navigation and field craft (NCC)

- Camp organisation – planning, logistics, safety protocols
- Adventure activities: trekking, rock-climbing, swimming (awareness)
- Disaster management – concepts, types, roles of NSS/NCC volunteers
- First Aid – CPR, wound management, fractures, snake bite, burn

Unit III: Community Projects, Social Awareness and Service Documentation:

- Community needs assessment – participatory methodology
- Project planning: Swachh Bharat, Pulse Polio, Blood Donation camps
- Literacy campaigns and awareness drives (PadhnaLikhna Abhiyan)
- Environmental conservation – plantation, solid waste, water conservation
- Gender sensitisation and women empowerment programmes
- Digital literacy and e-governance outreach
- Documentation and reporting of service-learning activities
- Reflection, portfolio preparation and field report writing

Text Books:

8. Swachh Bharat Campaign Activities – https://youtu.be/swachh_sb_08

AI-Integrated Activities:

S. No.	AI Activity	Description / Tool

1.	AI-Assisted Community Needs Survey	Use ChatGPT / Gemini to design survey questionnaires; analyse crowd-sourced responses with AI tools to map priority community issues.
2.	Virtual Camp Planning Simulator	Use Notion AI / Trello AI to simulate camp logistics, assign roles and generate contingency plans for adverse scenarios.
3.	Disaster-Risk FAQ Chatbot	Students build a first-aid guidance chatbot using Dialogflow / Botpress and deploy it for community awareness.
4.	AI Social Media Campaign Design	Use Canva AI / Adobe Firefly to create Swachh Bharat / blood-donation awareness posters; schedule with Buffer AI.
5.	Reflective Portfolio with AI Writing Aid	Draft field reports using Grammarly / ChatGPT; critically compare AI-generated drafts with self-written reflections.

B. Tech. – I Year

II Semester

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26BSHB102T	BS	**Differential Equations & Vector Calculus** (Common for all branches of Engineering)	3	0	2	0	4

Pre-Requisites: Linear Algebra and Calculus

Course Objectives:

- To develop analytical and computational competence in solving ordinary and partial differential equations arising in engineering systems.
- To enable students to interpret vector differential and integral operators in physical and engineering contexts.
- To integrate mathematical modeling, visualization, and simulation using modern AI-assisted computational tools in alignment with NEP 2020.
- To apply ODE and PDE solution methods to model real-world engineering phenomena such as circuits, vibrations, heat transfer, and fluid flow.
- To use computational tools for solving, verifying, and visualizing differential equations and vector field problems.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Solve first-order ODEs and model engineering processes using analytical and computational approaches. (L3)

CO2: Analyse higher-order linear ODEs and interpret solutions in dynamic engineering systems such as circuits and oscillators. (L4)

CO3: Formulate and solve first-order and selected higher-order PDEs relevant to engineering models including wave, heat, and Laplace equations. (L3)

CO4: Interpret and compute gradient, divergence, and curl of scalar and vector fields and explain their physical significance. (L4)

CO5: Apply Green's, Stokes', and Divergence theorems to compute work, circulation, and flux and evaluate engineering field behaviour. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	1		1				2	2	1
CO2	3	3	3	2	2		1				2	2	2
CO3	3	2	2	2	1		1				2	2	1
CO4	3	3	3	3	2		1				2	2	2
CO5	3	3	2	3	3		1				2	2	2

Unit I: First-Order Ordinary Differential Equations:

Core Content: Classification of ODEs by order, degree, and linearity; linear first-order ODEs and integrating factor method; Bernoulli's equation; exact equations and integrating factors; orthogonal trajectories; Engineering applications of first-order ODEs; Newton's law of cooling and natural growth/decay models; electrical circuit models (RC and RL circuits); engineering applications of first-order ODEs.

AI Integration: Python SymPydsolve for symbolic ODE solution and verification; direction field (slope field) visualization using Matplotlib; AI-assisted debugging of integrating factor derivations; using ChatGPT/Copilot to explain solution families and physical interpretations; SciPy solve_ivp for numerical ODE solution with initial conditions.

Free/Open-Source AI Tools: Python (SymPy, SciPy, Matplotlib) on Google Colab; Jupyter Notebook; Wolfram Alpha free tier for solution verification; GNU Octave for ODE routines.

Unit II: Higher-Order Linear Differential Equations:

Core Content: Superposition principle; Wronskian and linear independence; complementary function for constant-coefficient ODEs (distinct real, repeated, and complex roots); particular integral by operator method; variation of parameters; simultaneous linear ODEs; Cauchy's (Euler) equation; Legendre's equation; applications to LCR circuits, simple harmonic motion, damped and forced oscillations; mass-spring-dashpot systems.

AI Integration: Python SciPy signal.lsim for simulation of underdamped, critically damped, and overdamped responses; resonance amplitude curve generation; AI-assisted Wronskian computation and verification using SymPy; using AI tools to explain transient vs. steady-state response; resonance and Q-factorinterpretation.

Free/Open-Source AI Tools: Python (NumPy, SciPy, SymPy, Matplotlib) on Google Colab; Jupyter Notebook; GNU Octave / MATLAB (optional) for LCR and mechanical system simulation; WolframAlpha free tier.

Unit III: Partial Differential Equations:

Core Content: Introduction and classification of PDEs; formation by elimination of arbitrary constants and functions; first-order linear PDEs and Lagrange's method; homogeneous linear PDEs with constant coefficients (CF and PI); standard forms of nonlinear first-order PDEs; Classification as hyperbolic, parabolic, and elliptic. Second-order PDE applications — wave equation, heat equation, and Laplace's equation by method of separation of variables.

AI Integration: Python SymPy for PDE formation and symbolic verification; 3D surface plot visualization of PDE solution families using Matplotlib; SciPy finite-difference simulation of the 1D heat equation with animation; AI-assisted PDE classification using the discriminant; prompting AI to classify mixed-derivative PDEs and student verification of AI reasoning.

Free/Open-Source AI Tools: Python (SymPy, NumPy, SciPy, Matplotlib) on Google Colab; Jupyter Notebook; Wolfram Alpha free tier for PDE classification verification; Scilab.

Unit IV: Vector Differentiation:

Core Content: Scalar and vector fields; del (∇) operator; gradient and directional derivative; unit normal to surfaces; angle between surfaces; divergence and physical interpretation; curl and physical interpretation; vector identities; conservative fields and scalar potentials; Laplacian; engineering applications of Gradient, Divergence, and Curl in electromagnetic and fluid mechanics contexts.

AI Integration: Python NumPy and Matplotlib for 2D and 3D gradient, divergence, and curl field visualization (quiver plots, level-surface overlays); SymPy for symbolic verification of vector identities; using AI tools to interpret Maxwell’s equations in terms of divergence and curl operators; AI-assisted explanation of irrotational and solenoidal field classification.

Free/Open-Source AI Tools: Python (NumPy, SymPy, Matplotlib, mpl_toolkits) on Google Colab; Jupyter Notebook; SciPy for numerical gradient computation; GNU Octave.

Unit V: Vector Integration and Integral Theorems:

Core Content: Line integrals over scalar and vector fields; work done and path independence; surface integrals and flux; Green's theorem in the plane and its applications; Stokes' theorem; Divergence theorem (Gauss's theorem); applications to area and volume computation; engineering applications in electromagnetism, fluid mechanics, and mass conservation.

AI Integration: Python SciPy integrate for numerical computation of line and surface integrals; 3D flux visualization with colour-coded normal flux using Matplotlib; numerical verification of Green’s and

Stokes' theorems; AI-assisted physical interpretation of the Divergence theorem in terms of source density; prompting AI to explain connections to Gauss's law and student evaluation of AI explanations.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; Jupyter Notebook; SymPy for symbolic integral verification; WolframAlpha free tier; 3D plotting tools.

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26BSHB109T	BS	Engineering Chemistry for Electronics and Communication Systems	3	0	0	0	3

Pre-Requisites: Basic Chemistry (Intermediate), and Physics for Communication Systems.

Course Objectives:

- To understand quantum chemistry concepts relevant to electronic systems.
- To study spectroscopy techniques used in material and signal analysis.
- To analyse semiconductor and electronic material chemistry.
- To explore electrochemical energy storage for communication systems.
- To apply AI/ML tools for materials analysis, device reliability, and energy optimization.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply quantum chemistry principles to analyse electronic systems and predict molecular orbital properties. (L3)

CO2: Evaluate semiconductor materials and chemical fabrication processes relevant to electronic device manufacturing. (L5)

CO3: Analyse energy storage systems and electrochemical principles for communication device power management. (L4)

CO4: Design corrosion prevention and reliability strategies for electronic components using AI-assisted analysis. (L5)

CO5: Analyse spectroscopic techniques for material characterization and interpret spectral data for molecular identification. (L4)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	3	2	1	1				2	1	1
CO2	3	3	3	2	3	2	1				2	2	2
CO3	2	3	2	3	3	2	1				2	2	2
CO4	3	2	3	3	3	2	1				3	2	2
CO5	3	3	3	2	3	1	1				2	2	1

Unit I: Quantum Chemistry:

Core Content: Fundamentals of quantum chemistry — black body radiation, photoelectric effect, wave-particle duality, de-Broglie wave equation, Heisenberg's uncertainty principle. Fundamentals of quantum mechanics, Schrödinger wave equation, significance of Ψ and Ψ^2. Quantum numbers. Particle in a one-dimensional box. Molecular orbital theory — bonding in homo and hetero nuclear diatomic molecules — energy level diagrams of O_2 and CO. π-molecular orbitals of butadiene and benzene, calculation of bond order.

AI Integration: Simulation of quantum systems using Python. Visualization of molecular orbitals and energy levels. Introduction to quantum computing models.

Free/Open-Source AI Tools: Python (NumPy, SciPy), Google Colab.

Unit II: Chemistry of Electronic Materials:

Core Content: Atomic structure and chemical bonding relevant to semiconductors. Band theory: valence band, conduction band, band gap energy. Intrinsic and extrinsic semiconductors: silicon, germanium, gallium arsenide. Doping chemistry: n-type (phosphorus, arsenic) and p-type (boron, aluminum) dopants.

Chemical vapor deposition (CVD) for thin film formation. Silicon dioxide (SiO_2) formation and properties. Chemistry of compound semiconductors: GaAs, InP, SiC.

AI Integration: AI-based prediction of semiconductor properties and fabrication optimization. Data-driven defect analysis in semiconductor wafers.

Free/Open-Source AI Tools: TensorFlow, Python, Scilab

Unit III: Electrochemistry and Energy Storage:

Core Content: Fundamentals of electrochemistry: redox reactions, electrode potential, Nernst equation. Galvanic cells and electrolytic cells. Energy storage: batteries — primary batteries (zinc-air, sodium-air), secondary batteries (lead-acid, NiCd, NiMH), lithium-ion batteries ($LiFePO_4$). Supercapacitors: EDLC, pseudo capacitors for energy harvesting. Fuel cells: PEMFC, DMFC for backup power. Energy harvesting: solar cells (dye-sensitized, perovskite), thermoelectric generators. Battery management: charging algorithms, state of charge, thermal management.

AI Integration: AI models for battery health monitoring and energy optimization in IoT devices. Predictive analytics for battery life and performance.

Free/Open-Source AI Tools: Python (Pandas, scikit-learn), Google Colab

Unit IV: Corrosion Chemistry and Protection:

Core Content: Corrosion: definition, types — chemical corrosion and electrochemical corrosion, Pilling-Bedworth rule. Galvanic corrosion, concentration cell corrosion. Factors affecting corrosion. Deal-Grove model — thermal oxidation of silicon, passivation layers (SiO_2, Si_3N_4, Al_2O_3). Corrosion of printed circuit boards: copper oxidation, tin whiskers. Corrosion in solder joints and interconnects. Protective techniques: proper design, pure metal, metal alloys, inhibitors. Cathodic protection. Electroplating (nickel) and electroless plating (copper).

AI Integration: Computer vision for PCB defect detection. AI-based prediction of corrosion failure in electronic components.

Free/Open-Source AI Tools: OpenCV, TensorFlow, Python

Unit V: Spectroscopy:

Core Content: Introduction, types of energy in molecules, types of spectra, representation and general features of absorption spectra. Microwave spectroscopy — introduction, principle, instrumentation and applications. UV-Visible spectroscopy — chromophore, auxochrome, bathochromic shift, hypsochromic shift, Beer-Lambert law, principle, instrumentation and applications. Infrared (IR) spectroscopy — introduction, principle, instrumentation and applications.

AI Integration: AI-based spectral analysis and pattern recognition. Automated identification of compounds using machine learning models.

Free/Open-Source AI Tools: Python (Pandas, scikit-learn), spectroscopy datasets, Google Colab

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26HMHS101T	HM	**Communicative English** (Common for all branches of Engineering)	2	0	0	0	2

Pre-Requisites: Basic English (Intermediate level).

Course Objectives:

- To develop strong foundations in English grammar, vocabulary, phonetics, and communication models essential for professional contexts.
- To develop listening, speaking, reading, and writing skills using structured activities and AI-powered tools.
- To enable students to compose professional emails, reports, and presentations using AI writing assistants.
- To develop critical analysis of communication styles, barriers, and discourse structures using AI tools.
- To cultivate responsible AI usage for language learning — verifying AI outputs, maintaining academic integrity, and using AI as an aid not a substitute.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply the principles of communication, grammatical structures, tenses, subject–verb agreement, phonetic patterns, and vocabulary skills to identify and correct language errors and demonstrate effective spoken and written communication using AI-assisted tools. (L3)

CO2: Apply effective listening, speaking, group discussion, presentation, and debate techniques to organize and deliver clear, confident, and persuasive oral communication using AI-assisted tools for speech analysis, transcription, and visual presentation design. (L3)

CO3: Apply reading and writing strategies to comprehend, organize, and produce clear paragraphs, creative content, movie reviews, and blogs using AI-assisted paraphrasing, readability, simplification, and content-structuring tools. (L3)

CO4: Analyze professional and business communication requirements to evaluate and improve the structure, tone, formality, and effectiveness of emails, letters, reports, summaries, resumes, and LinkedIn profiles using AI-assisted communication tools. (L4)

CO5: Evaluate the effectiveness, accuracy, and ethical implications of AI-assisted language learning and communication tools, with regard to translation, plagiarism, academic integrity, bias, privacy, misinformation, and responsible digital communication. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1						1	1	1	3		2		
CO2						2	1	2	3		2		
CO3						2	2	3	3		2		
CO4						2	2	2	3		2		
CO5						2	3	2	3		3		

Unit I: Foundations of English Communication:

Core Content: Basics of Communication: process, types (verbal/non-verbal), and barriers. Parts of Speech: nouns, pronouns, verbs, adjectives, adverbs. Tenses: simple, continuous, perfect, and perfect continuous. Subject-verb agreement and correction of sentences.

AI Integration: Grammar explanation, error identification, and instant Q&A on language rules, Real-time grammar, spelling, and punctuation correction with detailed explanations, Phonetics practice – voice

recording for pronunciation and intonation feedback, Word-of-the-day, etymology, and interactive vocabulary quizzes.
Free/Open-Source AI Tools: Grammarly (free); ChatGPT / Gemini (free tiers); Google Speech-to-Text (free); Merriam-Webster Vocabulary Builder (free)

Unit II: Listening and Speaking Skills:
Core Content: Principles of Effective Speaking and Active Listening. Group Discussion (GD): techniques, etiquette, and evaluation criteria. Presentation Skills: design principles, slide preparation, and delivery techniques. Debate: argument construction, evidence use, and rebuttal techniques.
AI Integration: AI-powered presentation design – structured, visual, professional slides, Fluency analysis, filler-word detection, pacing, and confidence scoring, Auto-transcription and keyword analysis of spoken communication, Visual communication design – infographics, posters, and slide aesthetics
Free/Open-Source AI Tools: Gamma.app (free); Orai AI Speech Coach (free); Otter.ai (free tier); Canva AI (free)

Unit III: Reading Comprehension & Writing Skills:
Core Content: Reading Strategies: skimming, scanning, intensive and extensive reading. Comprehension passages, synonyms, antonyms, words often confused, homonyms, homophones, and homographs. Paragraph Writing: topic sentence, supporting details, clincher sentence. Creative Writing — features and techniques — movie reviews and blogs.
AI Integration: AI paraphrasing tool – rewrite passages at varying complexity levels, Readability scoring, passive voice detection, and sentence simplification, Essay outline generation, argument structuring, and content brainstorming, Vocabulary simplification for improving comprehension of complex texts
Free/Open-Source AI Tools: QuillBot (free); Hemingway Editor (free online); ChatGPT (free); Rewordify (free)

Unit IV: Professional & Business Communication:
Core Content: Email Writing and Letter Writing: formal and informal. Short Report Writing: structure, types (formal/informal), and format. Note-Making and Summarization Techniques. Resume / CV Writing and LinkedIn Profile Optimization.
AI Integration: Draft and refine professional emails, cover letters, reports, and proposals, AI-powered resume builder with ATS-optimized templates, Report structuring, agenda writing, and knowledge management, Tone detection, formality check, and professional register evaluation
Free/Open-Source AI Tools: ChatGPT (free); Kickresume (free tier); Grammarly (free); Notion AI (free tier)

Unit V: Use of AI in Language Learning:
Core Content: Artificial Intelligence in Communication: meaning, basics, benefits and limitations of AI in human interaction. AI chatbots and virtual assistants in education: grammar correction, vocabulary building, AI-based speaking and pronunciation tools, writing assistants, e-portfolio creation. AI in Global Communication: automated translation, summarizing large texts, finding information in different languages. Digital Communication and AI Ethics: responsible use of AI in education, plagiarism and academic honesty, fake information and AI-generated content, privacy, bias, and ethical communication online.
AI Integration: Plagiarism detection, paraphrase checker, and academic integrity analysis, High-accuracy translation supporting intercultural communication understanding, AI literacy modules –

understanding AI bias, ethics, and responsible usage, E-portfolio creation platform for showcasing communication artifacts

Free/Open-Source AI Tools: Copyleaks / Turnitin (institutional access); DeepL Translator (free); Wix (free); Adobe Portfolio (free for students); ChatGPT / Gemini (free tiers)

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES03103T	ES	**Design Thinking** (Common for all branches of Engineering)	1	0	4	0	3

Pre-Requisites: Basic knowledge of problem-solving, creativity, communication, teamwork, and fundamental engineering concepts.

Course Objectives:

- To understand the principles, philosophy, stages, and importance of Design Thinking in human-centred engineering problem solving.
- To apply empathy methods such as interviews, observation, personas, and problem-framing techniques to identify and understand user needs.
- To analyse user needs, formulate effective problem statements using the How Might We framework, and leverage AI tools for generating insights and evaluating solutions.
- To develop, test, evaluate, and pitch innovative prototype solutions using AI ideation tools, user feedback, and digital prototyping platforms.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Recall and understand the philosophy, principles, and stages of the Design Thinking process and its relevance to human-centred problem solving. (L3)

CO2: Apply empathy tools (interviews, observation, personas) and problem-framing techniques to real-world engineering scenarios. (L3)

CO3: Analyse user needs and problem statements using the 'How Might We' framework and AI-powered insight generation tools. (L4)

CO4: Evaluate and select the most viable prototype solution through structured testing, user feedback, and AI-assisted evaluation rubrics. (L5)

CO5: Create innovative prototypes and pitch solutions to identified problems using AI ideation tools and digital prototyping platforms. (L6)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	1	2	2	1	1	2	1				2	1	1
CO2	1	2	3	2	2	3	1				2	1	1
CO3	2	3	3	2	3	3	1				3	1	2
CO4	2	3	3	3	3	2	2				3	1	2
CO5	2	3	3	3	3	2	2				3	1	2

Unit 1: Introduction to Design Thinking:

Core Concepts:

- Design Thinking: Definition, origin (Stanford d.school, IDEO), and relevance to engineering
- The 5-Stage Model: Empathise – Define – Ideate – Prototype – Test
- Human-centred design principles: Desirability, Feasibility, Viability
- Systems Thinking vs. Linear Thinking: Understanding complexity
- Case Studies: Successful design thinking applications (IDEO shopping cart, Stanford Mobile Clinic)

AI Integration:

- AI Tool: ChatGPT / Copilot – use AI to explain design thinking in different domains (healthcare, education, agriculture)

- Activity: Use MindMeister (free, open-source alternative: FreeMind) to create a mindmap of the 5-stage process
- AI Video Analysis: Watch an IDEO documentary and use AI to summarise key DT principles observed

Unit II: Empathise and Define Stages:

Core Concepts:

- Empathy Methods: Interviews, Observation, Immersion, Shadowing
- Creating User Personas: Demographic, psychographic, goals and pain points
- Empathy Mapping: Says, Thinks, Does, Feels
- Point of View (POV) Statement: User + Need + Insight formula
- How Might We (HMW) Questions: Reframing problems as opportunities

AI Integration:

- AI Tool: Miro (free plan) – create digital empathy maps and POV statements collaboratively
- AI Tool: ChatGPT – generate diverse user persona profiles for a given problem context
- Activity: Interview 5 peers about a campus problem; use AI to analyse interview transcripts and extract themes
- AI Tool: Dovetail (free plan) – affinity mapping of qualitative research data

Unit III: Ideation Stage:

Core Concepts:

- Creative Thinking Techniques: Brainstorming, Brainwriting, SCAMPER, Random Word Association
- Lateral Thinking: Edward de Bono's Six Thinking Hats
- Affinity Diagramming: Grouping ideas by themes
- Prioritisation Matrix: Impact vs. Effort, Dot Voting
- Concept Selection: Morphological charts and Pugh Matrix

AI Integration:

- AI Tool: ChatGPT – use 'expand my idea' prompts to generate 20 variations of a concept
- AI Tool: IdeaFlip (free) / Miro – digital brainstorming and affinity diagramming
- AI Tool: Midjourney (free trial) / DALL-E (free credits) – generate visual concept sketches from text descriptions
- Activity: Run a 30-minute AI-augmented brainstorming session and compare idea quality with pure human brainstorming

Unit IV: Prototyping:

Core Concepts:

- Principles of Prototyping: Low-fidelity vs. High-fidelity prototypes
- Paper Prototyping: Sketching UI and physical models
- Digital Wireframing: Introduction to wireframes and mockups
- 3D Prototyping Concepts: Introduction to 3D printing and rapid prototyping
- Role Plays and Experience Prototyping: Service design scenarios

AI Integration:

- AI Tool: Figma (free plan) – create digital wireframes and interactive mockups
- AI Tool: Uizard (free plan, AI-powered) – convert hand-drawn sketches to digital wireframes using AI
- AI Tool: Tinkercad (free, web-based) – create simple 3D models for physical prototyping
- Activity: Build a paper prototype for a chosen problem and photograph for digital documentation

Unit V: Testing, Iteration and AI in Design:

Core Concepts:

- User Testing Methods: Think-aloud protocol, A/B testing, Usability testing
- Feedback Analysis: Affinity mapping of test feedback
- Iteration Cycle: Incorporating feedback and pivoting
- Design Presentation: Pitching to stakeholders (elevator pitch, demo day format)
- AI in Design: Overview of AI-assisted design (generative design, co-creation with AI)

AI Integration:

- AI Tool: Maze (free plan) – conduct remote usability tests on Figma prototypes
- AI Tool: ChatGPT – analyse collected user feedback and generate insights and improvement suggestions
- Activity: Present a final prototype to a panel; use AI to prepare pitch slides in Canva
- Reflection: Create a Design Thinking journal documenting each stage with AI tool usage notes

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26PC02104T	PC	Network Analysis	2	0	2	0	3

Pre-Requisites: Basic Electrical Engineering, and Engineering Mathematics.

Course Objectives:

- To understand types of circuit elements, source transformations, and methods of mesh and nodal analysis for resistive networks.
- To apply fundamental network theorems for circuit simplification and problem solving.
- To analyse transient responses of RL, RC, and RLC circuits and solve them using differential equations and Laplace transform techniques.
- To perform steady-state AC circuit analysis using impedance, phasor notation, and resonance concepts.
- To characterise two-port networks using parameters and apply them to cascaded and matched network configurations.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Analyse resistive networks using mesh analysis, nodal analysis, source transformations, and network theorems (Thevenin's, Norton's, Superposition, Maximum Power Transfer) to determine voltages, currents, and power in circuits with dependent sources. (L4)

CO2: Apply Laplace transform techniques and initial condition procedures to solve transient responses of first-order RL and RC circuits and second-order RLC circuits under DC and AC excitation. (L3)

CO3: Perform steady-state AC circuit analysis using phasor notation, complex impedance, and Star-Delta conversion for series and parallel R-L-C circuits using mesh and nodal methods. (L3)

CO4: Evaluate series and parallel resonance characteristics including resonant frequency, Q-factor, and bandwidth, and analyse magnetically coupled circuits using self-inductance, mutual inductance, and the dot rule. (L5)

CO5: Derive and apply Z, Y, h, and ABCD two-port network parameters for the analysis, cascading, and design of attenuators, pads, and impedance matching networks. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	2		1				1	3	2
CO2	3	3	2	2	2		1				2	3	3
CO3	3	3	2	1	2		1				1	3	3
CO4	3	3	2	2	2		1				2	3	3
CO5	3	3	3	2	2		1				2	3	3

Unit I: Circuit Analysis of Resistive Networks & Network Theorems:

Core Content: Types of circuit components, types of sources and source transformations, mesh analysis and nodal analysis, problem solving with resistances only including dependent sources. Principle of duality with examples. Network Theorems: Thevenin's, Norton's, Reciprocity, Superposition, and Maximum Power Transfer theorems — problem solving using dependent sources.

AI Integration: Use AI/LLM tools to explain mesh and nodal analysis with step-by-step worked examples; solve resistive circuits using KVL/KCL and prints branch currents; prepare a mesh vs. nodal comparison table and validate it using AI tools.

Free/Open-Source AI Tools: Python (NumPy, SymPy) on Google Colab; PartSim, Falstad Circuit Simulator; ChatGPT / Gemini; NPTEL Network Analysis lectures.

Unit II: Transients & Laplace Transform:

Core Content: First-order differential equations, definition of time constants, R-L circuit and R-C circuit with DC excitation, evaluating initial conditions procedure. Second-order differential equations — homogeneous and non-homogeneous — problem solving using R-L-C elements with DC and AC excitation. Laplace transform: introduction, basic theorems, problem solving using Laplace transform, and partial fraction expansion.

AI Integration: Use AI/LLM tools to explain the time constant of RL/RC circuits and sketch voltage/current evolution; plot step responses and shows how τ shifts with component values; demonstrate partial fraction expansion and Laplace-based RLC solutions, check answers against initial and final conditions.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; Scilab; Falstad Circuit Simulator; ChatGPT / Gemini; NPTEL video lectures.

Unit III: Steady State Analysis of AC Circuits:

Core Content: Impedance concept, phase angle, series R-L, R-C, and R-L-C circuits — problem solving. Complex impedance and phasor notation for R-L, R-C, and R-L-C circuits — problem solving using mesh and nodal analysis. Star-Delta conversion.

AI Integration: Use AI/LLM tools to explain impedance, admittance, and phasor notation; solve a series R-L-C circuit for Z, I, and phase angle. plot impedance vs. frequency to identify resonant frequency; demonstrate Star-Delta conversion and compare series vs. parallel R-L-C behaviour.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; Falstad Circuit Simulator; AC phasor calculators online; ChatGPT / Gemini; NPTEL AC circuits lectures.

Unit IV: Resonance & Coupled Circuits:

Core Content: Resonance: introduction, definition of Q-factor, series resonance, bandwidth of series resonance, parallel resonance, general case with resistance in both branches. Coupled Circuits: self-inductance, mutual inductance, coefficient of coupling, analysis of coupled circuits, natural current, dot rule of coupled circuits — problem solving.

AI Integration: Use AI/LLM tools to explain resonant frequency, Q-factor, and bandwidth; verify f_0 and Q and confirm bandwidth = f_0/Q, plot the frequency response; mark the −3 dB points, read bandwidth, and compare with analytical results; apply the dot rule to a coupled circuit for polarity verification.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; Falstad Circuit Simulator; ChatGPT / Gemini; NPTEL resonance and coupled circuits lectures.

Unit V: Two-Port Networks:

Core Content: Relationship of two-port networks, Z-parameters, Y-parameters, Transmission (ABCD) parameters, h-parameters, relationships between parameter sets. Series and parallel connection of two-port networks, cascading of two-port networks — problem solving using dependent sources. Insertion loss, attenuators and pads, impedance matching networks.

AI Integration: Use AI/LLM tools to explain Z, Y, h, and ABCD parameters and demonstrate Z-to-Y conversion via matrix inversion; compute and validate Z/Y parameters; explain ABCD cascading and verify output voltage for two cascaded T-networks with a given load.

Free/Open-Source AI Tools: Python (NumPy) on Google Colab; two-port network calculators online; ChatGPT / Gemini; NPTEL two-port network lectures; Scilab.

Recommended Free & Open-Source AI/Computational Tools:

1. Python (NumPy, SciPy, Matplotlib) – FREE on Google Colab for circuit simulation and Laplace transform analysis
2. Scilab (free, open-source) – For matrix-based circuit and two-port network computations
3. Falstad Circuit Simulator (free, open-source) – For interactive circuit visualisation and transient analysis
4. PartSim (free online) – SPICE-based circuit simulation for verification
5. ChatGPT / Gemini (free tiers) – AI/LLM tools for concept explanation and step-by-step problem walkthrough
6. NPTEL Video Lectures – Free network analysis and circuit theory courses

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26BSHB109P	BS	Engineering Chemistry for Electronics and Communication System Lab	0	0	0	3	1.5

Pre-Requisites: Engineering Chemistry and Basic Sciences.

Course Objectives:

- To perform classical wet chemical analyses (redox, acid-base) on industrially relevant systems including battery electrolytes and iron solutions.
- To determine corrosion rates and understand the influence of environmental factors using standard electrochemical and gravimetric methods.
- To apply instrumental methods—conductometry, potentiometry, spectrophotometry, and IR spectrophotometry—for quantitative and qualitative chemical analysis.
- To synthesise a polymer (Bakelite) and relate its properties to structure and industrial relevance for electronics applications.
- To automate experimental data analysis using Python and develop AI-based models for corrosion prediction and spectral analysis.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Perform redox and acid-base titrations (Experiments 1, 2); determine iron (Fe^{2+}) concentration using $K_2Cr_2O_7$ and acid strength in battery electrolytes; compute molarity, normality, and percentage strength from titre data; interpret equivalence point from titration curves. (L3)

CO2: Measure corrosion rates by weight loss and electrochemical methods (Experiments 3, 4); evaluate the effect of environmental variables (pH, temperature, NaCl concentration) on corrosion behaviour; compute corrosion rate in mdd or mpy units and interpret passivation trends. (L3)

CO3: Perform conductometric and potentiometric titrations (Experiments 5, 6, 7); identify equivalence points from conductance vs. volume and potential vs. volume plots; explain the difference in conductance profiles between strong-acid/strong-base and weak-acid/strong-base systems; determine concentration of unknown samples. (L4)

CO4: Synthesise Bakelite (Experiment 8); determine the wavelength of maximum absorption and verify Beer–Lambert law using spectrophotometry (Experiment 9); identify functional groups in organic compounds from IR spectra (Experiment 10); correlate absorption peaks with molecular structure. (L4)

CO5: Automate titration curve plotting and endpoint detection using Python (NumPy/Matplotlib); develop an AI-based corrosion rate predictor using scikit-learn Random Forest regression; perform spectral regression to verify Beer–Lambert law and compute molar absorptivity; evaluate model performance using R^2 and RMSE. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	3	3	1	3	3	3		2	2	1
CO2	3	3	2	3	3	3	3	3	3		2	2	2
CO3	3	3	2	3	2	3	3	3	3		2	2	2
CO4	3	3	3	3	3	1	3	3	3		3	2	2
CO5	3	3	3	3	3	2	3	3	3		3	3	2

List of Experiments:

Part A: Regular Experiments:

1. Estimation of Ferrous Iron (Fe^{2+}) using Potassium Dichromate ($K_2Cr_2O_7$) – Redox Titrations
2. Determination of Strength of Acid in Lead Acid Battery

3. Determination of Corrosion Rate (Weight Loss Method)
4. Determination of Corrosion by Environment (Effect of pH, Salt Concentration, and Temperature)

Instrumental Methods of Chemical Analysis:

5. Conductometric Titration of Strong Acid vs. Strong Base (HCl vs. NaOH)
6. Conductometric Titration of Weak Acid vs. Strong Base (CH_3COOH vs. NaOH)
7. Potentiometry (Redox Titration) – Estimation of Iron (Fe^{2+}) using Potassium Dichromate ($K_2Cr_2O_7$)
8. Preparation of a Polymer (Bakelite)
9. Spectrophotometry – Determination of Wavelength (λ) and Verification of Beer–Lambert Law
10. Identification of Functional Groups in Organic Compounds by IR Spectrophotometer

Part B: AI Integration Lab Exercises:

- Titration Data Automation (Python / Google Colab): input burette readings from Experiments 1, 2, 5, 6, and 7; compute titre volumes, molarity, and strength; plot titration curves using Matplotlib; automate endpoint detection from conductance or potential vs. volume data.
- AI-Based Corrosion Prediction (scikit-learn): using a provided dataset of metal type, pH, temperature, salt concentration, and exposure time, train a Random Forest Regression model to predict corrosion rate; evaluate with R^2 and RMSE; compare predicted values with Experiment 3 and 4 results.
- Spectral Data Analysis (Python / NumPy): input absorbance vs. wavelength data from Experiment 9; plot absorbance spectrum; verify Beer–Lambert law by linear regression of absorbance vs. concentration; determine molar absorptivity (ε) and compare with standard values.

AI Integration:

AI integration adds three exercises following the regular experiments: (i) Python automation of titration curve plotting and endpoint detection from raw burette data (Experiments 1, 2, 5, 6, 7) using Matplotlib/NumPy; (ii) scikit-learn Random Forest regression for predicting corrosion rate from environmental parameters, validated against Experiment 3 and 4 results, with R^2 and RMSE evaluation; (iii) Python spectral regression for Experiment 9 – fitting absorbance vs. concentration data, computing molar absorptivity, verifying Beer–Lambert law, and overlaying the theoretical linear relationship.

Free / Open-Source AI Tools: Python (NumPy, Matplotlib, scikit-learn) – Google Colab (free); LibreOffice Calc (free) – data recording; Virtual Chemistry Lab – VLabs IIT (free)

Web Resources:

1. IEEE Electron Devices Society – https://eds.ieee.org
2. SEMI (Semiconductor Equipment and Materials International) – https://www.semi.org
3. Optica (OSA) – https://www.optica.org
4. IEC (International Electrotechnical Commission) – https://www.iec.ch
5. ECIA (Electronic Components Industry Association) – https://www.ecianow.org

Recommended Free & Open-Source AI/Computational Tools:

1. Python (NumPy, Matplotlib, scikit-learn) on Google Colab (free) – titration curve automation, spectral regression, AI corrosion prediction
2. scikit-learn (free, open-source) – Random Forest regression for corrosion rate prediction from environmental parameters
3. Virtual Chemistry Lab – VLabs IIT (free): https://chem-iitb.vlabs.ac.in – simulation of titrations, electrochemical and spectroscopic experiments
4. LibreOffice Calc (free, open-source) – standardised data recording templates for all experiments
5. ChemDraw / MolView (free online) – molecular structure drawing and IR peak prediction for Experiment 10

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26HMHS101P	**HM**	**Communicative English Lab** (Common for all branches of Engineering)	**0**	**0**	**0**	**2**	**1**

Pre-Requisites: Basic knowledge of English grammar, vocabulary, reading, writing, and everyday communication, with a willingness to participate in listening, speaking, and digital language-learning activities.

Course Objectives:

- To develop students' oral communication skills through structured speaking and listening exercises.
- To enhance pronunciation, intonation, and fluency using AI-assisted speech tools.
- To build professional communication competencies including group discussion, debate, and presentation skills.
- To enable students to write effective professional documents such as emails, reports, and cover letters.
- To integrate AI tools in language learning for self-assessment, feedback, and continuous improvement

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Pronounce English words correctly using standard phonemic symbols and demonstrate improved speech fluency. (L3)

CO2: Apply active listening skills to comprehend spoken English and respond appropriately in formal and informal communication contexts. (L3)

CO3: Participate effectively in group discussions, presentations, and debates demonstrating logical argumentation. (L4)

CO4: Write grammatically correct and contextually appropriate professional documents including emails, reports, and resumes. (L6)

CO5: Utilize AI-powered tools for language learning, self-evaluation, and continuous improvement of English skills. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1						**2**	**3**	**3**	**3**		**2**		
CO2						**2**	**3**	**3**	**3**		**2**		
CO3						**3**	**3**	**3**	**3**		**2**		
CO4						**2**	**3**	**3**	**3**		**2**		
CO5						**2**	**3**	**3**	**3**		**2**		

Lab Syllabus – 12 Topics with AI Integration:

S. No.	Lab Topic	Lab Activities	AI Activity	AI Tools	COs
1.	Phonetics & Pronunciation Practice	Record & playback vowel/consonant articulation; IPA chart drill; Minimal pair exercises	Use AI speech-to-text to detect mispronunciations; real-time phoneme feedback via ELSA Speak	ELSA Speak, Google Speech Recognition, Speechling	CO1 & CO5
2.	Listening	Listen to TED	Auto-generate	Otter.ai,	CO2

	Comprehension &Note-Taking	Talks/podcasts; fill-in-the-blank exercises; summarise audio passages	transcripts; compare student notes with AI-generated summaries using Otter.ai	YouTube Auto-captions, Whisper AI	& CO5
3.	Spoken English & Fluency Building	Impromptu speaking (1–2 min); picture description; story completion tasks	AI analyses speech for filler words, pace, and clarity; ChatGPT prompts for spontaneous speaking	Speeko, ChatGPT, Google Assistant	CO1, CO3 & CO5
4.	Group Discussion Techniques	Role-based GD on current topics; turn-taking practice; consensus building	AI evaluates argument structure and language; ChatGPT generates counter-arguments for practice	ChatGPT, Gemini, Mentimeter	CO2 & CO3
5.	Public Speaking & Presentations	Prepare and deliver 3-minute presentations; use of visual aids; Q&A handling	AI slide deck generation; real-time delivery feedback on pacing and confidence	Beautiful.ai, Gamma.app, Microsoft Copilot	CO3 & CO5
6.	Interview Skills & Mock Interviews	HR round simulation; STAR method answers; body language and eye contact	AI-powered mock interview with instant feedback on content, grammar, and tone	Yoodli, Interview Warmup by Google, ChatGPT	CO1, CO3 & CO5
7.	Professional Email & Business Writing	Draft formal emails, complaints, and requests; subject line formulation; netiquette	AI refines email drafts; tone & clarity check; compare student draft with AI-improved version	Grammarly, ChatGPT, Gemini	CO4 & CO5
8.	Resume & Cover Letter Writing	ATS-friendly resume design; action verbs usage; tailoring cover letters to job descriptions	AI resume scanner; keyword optimisation suggestions; ChatGPT cover letter generation and critique	Kickresume, Resume.io, Jobscan, ChatGPT	CO4 & CO5
9.	Reading Comprehension & Critical Thinking	Read articles/editorials; identify main idea, inference, and tone; speed reading drills	AI generates comprehension questions; text summarisation and comparative analysis	Quillbot, Speechify, NotebookLM	CO2 & CO4
10.	Debate & Argumentation Skills	Structured debate (for/against); Rebuttal techniques; logical fallacy identification	AI generates arguments on both sides; evaluate logical structure using ChatGPT	ChatGPT, Claude.ai, Kialo Edu	CO2 & CO3

11.	Report Writing & Technical Communication	Lab report, incident report, and project report formats; headings, data presentation	AI improves report coherence and passive/active voice usage; grammar and structure feedback	Grammarly Business, ChatGPT, Hemingway Editor	CO4 & CO5
12.	Etiquette, Netiquette & Personal Branding	Workplace conversation role play; LinkedIn profile creation; professional social media etiquette	AI reviews LinkedIn summaries; digital persona analysis; personal brand statement via ChatGPT	ChatGPT, Canva AI, LinkedIn AI features	CO3, CO4 & CO5

Lab Software & AI Tools Required:

Software / Tool	Type	Purpose
ELSA Speak	AI Pronunciation Coach App	Real-time speech accuracy & fluency feedback
Grammarly	AI Writing Assistant	Grammar, punctuation, style correction
ChatGPT / Claude.ai	Generative AI Chatbot	Conversation practice, writing assistance, debate prep
Otter.ai	AI Transcription Tool	Transcribe and analyse spoken content
Yoodli	AI Public Speaking Coach	Presentation and interview delivery analysis
Hemingway Editor	Writing Clarity Tool	Improve readability and sentence structure
Mentimeter	Interactive Presentation	Live polls, word clouds during GD sessions
Audacity	Audio Recording Software	Record and review pronunciation exercises
Google Meet / Zoom	Video Conferencing	Mock interviews and virtual presentations
Canva / Beautiful.ai	AI Presentation Design	Create professional visual presentations

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26PC02103P	PC	Electronics & Electrical Engineering Workshop	0	0	0	2	1

Pre-Requisites: Basic Physics and Mathematics (Class XII level);

Course Objectives:

- To gain hands-on proficiency in workshop tools, measuring instruments, and electronic components through assembly, testing, and theoretical vs. measured value comparison.
- To understand electrical systems and implement verified DC and AC circuits on breadboard and PCB experimentally.
- To measure and interpret electrical parameters — real power, power factor, earth resistance, and energy consumption — using standard instruments such as wattmeter, Megger, and energy meter.
- To apply Python and AI/LLM tools to automate data analysis, simulate circuit behaviour, and validate experimental results through regression and predictive modelling.
- To design a socially relevant mini project using AI/LLM tools and Python/MATLAB for simulation, analysis, and prediction.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Identify, handle, and test workshop tools, instruments, and electronic components; assemble and verify DC and AC circuits on breadboard and PCB using appropriate measuring instruments. (L3)

CO2: Calculate electrical energy consumption and power factor; implement and validate circuits through simulation and hardware, comparing experimental results with theoretical values. (L3)

CO3: Apply AI/LLM and/or Python/MATLAB tools for data analysis, simulation, and report generation; design and demonstrate a mini project with societal application integrating AI and hardware. (L5)

CO4: Measure earth resistance, real power, and power factor using standard instruments (Megger, wattmeter); compare readings against IS/IEEE permissible limits and interpret results. (L4)

CO5: Automate measurement data processing, energy prediction, and fault detection using Python (NumPy/Matplotlib/Scikit-learn); evaluate model accuracy using appropriate metrics. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	2	2	3	2	2	3	3	3			3	3
CO2	3	3	3	3	2	1	3	3	3			3	3
CO3	3	3	3	3	3	2	3	3	3			3	3
CO4	2	3	2	3	3	2	3	3	3			3	2
CO5	2	3	3	3	3	1	3	3	3			3	3

List of Activities:

Part A: Regular Activities:

1. Familiarization of commonly used workshop tools like breadboard, soldering iron, relays, switches, connectors, fuses, cutters, pliers, wire stripper, etc.; exercises for proper handling and usage.
2. Familiarization with voltmeters, ammeters, multimeter, LCR meter, power supplies, CRO/DSO, function generator, and frequency counter; perform basic measurement experiments.
3. Identification of components (R, L, C, diodes, transistors, ICs) — type, symbol, colour coding, and package; testing and comparison of theoretical vs. measured values.
4. Study of fundamental electrical concepts — voltage, current, power, AC/DC, single-phase, three-phase; understanding the working principles of transformers, generators, and motors.

5. Calculate energy consumption of domestic appliances and/or a premises using standard formulas; record and tabulate energy usage data for a given set of loads.
6. Measure real power and power factor of a single-phase AC circuit using a wattmeter; tabulate readings for different load conditions.
7. Measure earth resistance of the laboratory grounding electrode using a Megger instrument; tabulate readings and compare with permissible safety limits.
8. Assemble any two circuits — one with a DC source and one with an AC source — on a breadboard and test their functionality; observe and record output waveforms or measured parameters.
9. Assemble any two circuits — one with a DC source and one with an AC source — on a PCB and test their performance; compare measured results with expected values.
10. Design and implement an electronic or hobby circuit with a societal application (e.g., energy monitoring system, sensor-based automation, fault detection system); demonstrate working functionality.

Part B: AI Integration Lab Exercises:

- Any five activities must be implemented using appropriate AI/LLM tools and/or Python/MATLAB-based simulations.

Activity 1

a) Use AI/LLM tools to query tool datasheets and manufacturer specifications; generate an interactive Q&A to identify tool functions, correct handling postures, and safety hazards for each workshop tool.

b) Use LLM-generated safety checklists to create a Python-based scoring tool that evaluates a student's handling procedure against a standard rubric.

Activity 2

a) Use AI/LLM tools to explain the operating procedures of each instrument (CRO/DSO, LCR meter, function generator) and to interpret measurement results — including scale reading, range selection, and source of error.

b) Use Python (NumPy/Matplotlib) to plot measured voltage and current data; apply linear regression to verify Ohm's Law and estimate percentage error from ideal values.

Activity 3

a) Use AI/LLM tools for AI-assisted component identification — describe a component by its markings or package and receive datasheet summary, pin-out, and typical application; understand colour-code decoding for resistors and capacitors.

b) Use Python (Scikit-learn) regression to estimate device parameters (static resistance, capacitance, inductance) from LCR meter readings and compare with datasheet nominal values.

Activity 4

a) Use AI/LLM tools to relate fundamental electrical concepts (voltage, current, power factor, single/three-phase systems) to real-world applications — household wiring, industrial motors, and transformer ratings; generate concept maps.

b) Use Python to simulate single-phase and three-phase phasor diagrams (Matplotlib); model transformer turns ratio and calculate secondary voltage for given primary inputs.

Activity 5

a) Use AI/LLM tools to explain energy billing calculations, units (kWh), tariff slabs, and the impact of power factor on energy cost; generate a structured energy audit report for a given premises.

b) Use Python (Google Colab/Scikit-learn) to model and predict monthly energy consumption using linear regression; input appliance wattage and daily usage hours as features.

Activity 6

a) Use AI/LLM tools to explain power factor, reactive power compensation, and the effect of capacitive/inductive loads; auto-generate a power quality summary from wattmeter readings.

b) Use Python/MATLAB to plot real power, reactive power, and power factor against load variation; apply regression to model the relationship between load impedance and power factor.

Activity 7

a) Use AI/LLM tools to explain earth resistance standards (IS 3043/IEEE 80), the fall-of-potential method used by Megger, and the significance of low earth resistance for human safety; auto-generate a safety compliance report.

b) Use Python to analyse tabulated Megger readings; flag values exceeding safety thresholds using a rule-based classifier and plot resistance vs. electrode depth.

Activity 8

a) Use AI/LLM tools to interpret the circuit schematic, suggest component values, and debug functional faults based on described symptoms (e.g., no output, distorted waveform, wrong DC level).

b) Use Python/MATLAB to simulate both the DC and AC circuits before hardware implementation; compare simulated waveforms or voltage levels with measured breadboard results.

Activity 9

a) Use AI/LLM tools for PCB layout guidance — component placement rules, trace width calculation for current capacity, and design-rule-check (DRC) criteria; generate a bill of materials (BOM) from the schematic.

b) Validate the PCB design using MATLAB/Python simulation prior to fabrication; compare simulated and measured performance and quantify deviation using percentage error analysis.

Activity 10

a) Use AI/LLM tools throughout the project lifecycle — problem statement framing, circuit design justification, component selection rationale, testing strategy, and final report generation including abstract, block diagram description, and conclusion.

b) Integrate Python/MATLAB for data acquisition, analysis, or prediction within the project (e.g., regression-based energy forecasting, threshold-based fault classifier, sensor signal processing); include model training, validation, and result visualisation.

AI Integration: AI integration covers five selected activities: (i) Python-based tool safety scoring; (ii) Ohm's Law verification via NumPy/Matplotlib linear regression; (iii) LCR meter data regression for component parameters; (iv) Python phasor diagrams and transformer modelling; (v) linear regression-based energy prediction — each reinforcing the link between physical experimentation and computational analysis.

Free / Open-Source AI Tools: Python (NumPy, Matplotlib, Scikit-learn) – Google Colab (free); LTspice / Falstad Circuit Simulator (free) – circuit simulation; Virtual Labs – IIT (free) – online electrical experiments.

Recommended Free & Open-Source AI / Computational Tools:

1. Python (NumPy, Matplotlib, Scikit-learn) on Google Colab (free) – energy prediction, Ohm's Law regression, component parameter estimation
2. Scikit-learn (free, open-source) – linear regression and rule-based classifiers for energy forecasting and fault detection
3. LTspice / Falstad Circuit Simulator (free) – pre-hardware simulation of breadboard and PCB circuits
4. Virtual Labs – IIT (free): https://vlab.co.in – online simulation of electrical measurement experiments
5. LibreOffice Calc (free, open-source) – standardised data recording templates for all activities

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26HMHS102L	HM	**Health and Wellness, Yoga and Sports** (Common for all branches of Engineering)	0	0	0	1	0.5

Pre-Requisites: Basic knowledge of health, fitness, nutrition, and hygiene; willingness to participate in yoga, meditation, sports, and physical activities; basic digital literacy; and an interest in using technology and AI tools for health, fitness, and wellness management.

Course Objectives:

- To create awareness about holistic health, wellness and preventive healthcare among students.
- To train students in yogic practices (asanas, pranayama, meditation) for physical and mental well-being.
- To enable students to design evidence-based personal fitness and nutrition plans.
- To develop sportsmanship, team spirit, fair play and physical fitness through indoor and outdoor sports.
- To integrate technology and AI tools for health monitoring, performance analysis and wellness management.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Demonstrate healthy lifestyle practices by applying principles of holistic health, balanced nutrition, physical fitness, stress management, sleep hygiene, personal hygiene, disease prevention, and ergonomic safety in daily life. (L3)

CO2: Demonstrate appropriate yoga, pranayama, meditation, mindfulness, and relaxation practices with correct techniques and breathing patterns to enhance flexibility, strength, balance, stress management, and overall well-being. (L3)

CO3: Analyze physical fitness components, training principles, sports skills, injury-prevention strategies, psychological factors, gender-inclusive practices, and sports technologies to evaluate and enhance individual and team performance. (L4)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1						3	3	3	2		2		
CO2						3	3	3	2		2		
CO3						3	3	3	2		2		

Unit I: Health, Wellness and Preventive Healthcare:

- Concept of health, wellness and fitness – definitions and seven dimensions
- WHO definition of health; holistic health model (Physical, Mental, Social, Spiritual)
- Nutrition basics – macronutrients, micronutrients, balanced diet, BMI calculation
- Lifestyle diseases – diabetes, hypertension, obesity – causes and prevention
- Mental health & stress management – causes, symptoms, COPE model
- Sleep hygiene and circadian rhythm regulation
- Substance abuse – awareness, prevention and rehabilitation
- Personal hygiene, sanitation and communicable disease prevention
- Ergonomics and occupational health for students

Unit II: Yoga, Pranayama, Meditation and Mind-Body Practice:

- Introduction to Yoga – history, philosophy, Patanjali's Ashtanga Yoga

- Surya Namaskar – 12-step sequence with correct breathing
- Asanas for flexibility: Tadasana, Trikonasana, Paschimottanasana, Sarvangasana
- Asanas for strength & balance: Virabhadrasana I & II, Vrikshasana, Naukasana
- Pranayama techniques: Anulom-Vilom, Bhastrika, Kapalbhati, Bhramari
- Meditation and mindfulness – Dharana, Dhyana, body-scan, guided relaxation
- Yoga Nidra for sleep and stress relief
- Yoga for specific conditions – stress, back pain, PCOD/PCOS, anxiety
- Shatkarmas (cleansing processes) – an overview; International Day of Yoga

Unit III: Physical Fitness, Sports Skills and Sports Technology:

- Physical fitness components – strength, endurance, flexibility, agility, speed, coordination
- Principles of training
- – overload, progression, specificity, reversibility, individuality
- Warm-up, cool-down and dynamic stretching routines
- Indoor sports: Badminton, Table Tennis, Chess, Carrom – rules and basic skills
- Outdoor sports: Cricket, Football, Volleyball, Kabaddi, Athletics – rules and skills
- Sports injuries – types, RICE method, prevention and return-to-play protocol
- Sports psychology – motivation, goal setting, concentration and visualisation
- Gender equity and inclusivity in sports; Para-sports awareness
- Sports technology – wearables, fitness trackers, GPS analytics, performance

AI-Integrated Activities:

S. No.	AI Activity	Description / Tool
1.	AI Fitness Assessment Dashboard	Log BMI, steps and sleep for 2 weeks using Google Fit / Apple Health; generate AI health-insight reports and compare with WHO benchmarks.
2.	Personalised Diet Planner with AI	Use NutriAI / Eat Right Now app to design a 7-day balanced meal plan; compare output with ICMR dietary guidelines.
3.	Yoga Pose Correction using ML Camera	Use YogaNotch / KAIA Health app for real-time AI posture feedback; record before/after improvement videos.
4.	Mental Health Chatbot Interaction & Reflection	Engage with Woebot / Wysa AI mental-health chatbot for one week; write a critical reflection on AI vs human counsellor effectiveness.
5.	Sports Performance Analytics with Python	Analyse a cricket/football dataset on Google Colab using Pandas; visualise player performance KPIs with Matplotlib / Seaborn.

B. Tech. – I Year II Semester

Course Code	Category	Name of the Course	L	T	Pr.	P	C
26ES05102A	**MC**	**Cybersecurity Awareness for Engineers** (Common for all branches of Engineering)	**2**	**0**	**0**	**0**	**0**

Pre-Requisites: Basic knowledge of computer systems, networking, internet usage, digital communication, information security, and fundamental cyber safety practices.

Course Objectives:

- To introduce students to the fundamentals of cybersecurity and secure digital practices in modern society.
- To create awareness about cyber threats, cybercrimes, and methods for protecting personal and institutional digital assets.
- To develop responsible digital citizenship through cyber ethics, privacy awareness, and legal understanding.
- To enable students to adopt cyber hygiene practices for secure use of digital technologies.
- To familiarize students with emerging cybersecurity concerns in cloud, digital platforms, and AI-enabled environments.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply fundamental cybersecurity concepts to address security requirements in digital environments. (L3)

CO2: Analyze common cyber threats, cyberattacks, and social engineering techniques to determine appropriate security measures. (L4)

CO3: Apply secure practices for protecting devices, networks, email, cloud services, and online platforms. (L3)

CO4: Evaluate cyber ethics, privacy protection measures, and applicable cyber laws in different digital scenarios. (L5)

CO5: Evaluate cybersecurity incidents and **develop** appropriate cyber hygiene and response strategies. (L5)

CO – PO Articulation Matrix:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	**3**	**3**	**2**	**2**	**3**	**2**	**2**				**2**	**2**	**2**
CO2	**3**	**3**	**3**	**3**	**3**	**2**	**2**				**3**	**2**	**2**
CO3	**3**	**3**	**3**	**2**	**3**	**2**	**2**				**3**	**2**	**2**
CO4	**2**	**3**	**2**	**3**	**2**	**3**	**3**				**3**	**1**	**1**
CO5	**3**	**3**	**3**	**3**	**3**	**3**	**3**				**3**	**2**	**2**

Unit I: Introduction to Cyberspace and Cybersecurity:

Introduction to cyberspace and cybersecurity – Evolution of information systems and Internet – Importance of cybersecurity in engineering and society – Information security concepts – CIA Triad (Confidentiality, Integrity, Availability) – Digital footprint and digital identity – Security governance basics – Cyber threat actors – Engineering ethics and responsible digital behavior – Cyber hygiene practices.

Unit II: Cyber Threats, Cybercrime and Social Engineering:

Cyber threats and vulnerabilities – Cybercrime and cyber offenders – Malware: Virus, Worm, Trojan, Spyware, Ransomware – Cyberattack lifecycle and common attack methods – Phishing, Spear Phishing, Smishing and Vishing – Social engineering attacks – Password attacks and credential theft – Identity theft

and financial fraud – Insider threats – AI-enabled cyber threats and deepfakes – Case studies of major cyber incidents.

Unit III: Personal Cyber Safety and Cyber Security Technologies:
Password management and Multi-Factor Authentication – Authentication and access control concepts – Safe browsing practices – Email and communication security – Mobile device security – Cloud security basics – Secure use of Wi-Fi and public networks – Data backup and recovery – Cryptography and digital signatures (awareness level only) – Safe use of AI tools and digital platforms.

Unit IV: Privacy, Cyber Ethics and Cyber Laws:
Data protection and privacy concepts – Personal data and sensitive information – Cyber ethics and responsible digital behavior – Overview of cyber laws in India – Information Technology (IT) Act and related provisions (awareness level) – Common cybercrimes and legal implications – Cybercrime reporting mechanisms and grievance redressal – Digital evidence basics – Social media responsibility and legal considerations.

Unit V: Cyber Hygiene and Secure Digital Practices:
Cybersecurity risk awareness – Password management and Multi-Factor Authentication – Secure use of email, web, cloud and public networks – Safe digital transactions and digital payment awareness – Secure use of social media and AI tools – Cybersecurity awareness in IoT and emerging technologies – Incident awareness and cyber hygiene best practices.

Text Books:

1. Ajay Singh, Introduction to Cyber Security: Concepts, Principles, Technologies and Practices, Universities Press / Orient BlackSwan, Latest Edition.

B. Tech. – II Year
I Semester

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26BSHB211T	BS	**Complex Variables and Probability Theory** (Common to CE, EEE & ECE)	2	1	0	0	3

Pre Requisites: Linear Algebra and Calculus, Differential Equations & Vector Calculus

Course Objectives:

- To develop a thorough understanding of complex variable theory, analyticity, Cauchy-Riemann conditions, and harmonic functions as foundations for engineering analysis.
- To Apply complex integration techniques, series expansions, and the residue theorem to evaluate contour integrals and real definite integrals.
- To formulate probabilistic models using axioms, random variable theory, and standard distributions, and compute correlation and regression measures.
- To integrate analytical methods with AI-assisted computational tools for visualization, simulation, and verification.
- To develop outcome-oriented problem-solving skills aligned with NEP 2020 and modern engineering applications

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Apply the axioms and theorems of probability to solve problems and determine the properties of discrete and continuous random variables, including expectation and variance.(L3)

CO2: Evaluate probabilities using binomial, Poisson, and normal distributions and interpret correlation and regression relationships in engineering data sets.(L3)

CO3: Recall definitions of limits, continuity, and differentiability of complex functions and state the Cauchy-Riemann equations in Cartesian and polar forms.(L4)

CO4: Apply Cauchy's Integral Theorem, Cauchy's Integral Formula, Liouville's Theorem, and the Maximum Modulus Theorem to evaluate complex line integrals and solve related problems.(L3)

CO5: Analyze complex functions using Taylor's and Laurent's series, classify singularities, and evaluate real definite integrals by the residue theorem.(L5)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	1					1				1	1	1
CO2	3	2	1				1				1	2	2
CO3	3	3	2	2			1				1	1	1
CO4	3	2		1			1				1	1	1
CO5	3	3	1	2			1				1	2	2

Unit I: Probability & Random Variable:

Core Content: Sample space and events; axioms of probability; addition and multiplication theorems; conditional probability; Bayes' theorem; random variables: discrete and continuous; probability mass function; probability density function; cumulative distribution function; mathematical expectation and variance.

AI Integration: Python-based simulation of sample spaces and probability experiments; visualization of PMF, PDF, and CDF using Matplotlib; AI-assisted explanation of Bayes' theorem with real-world examples; NumPy/SciPy computation of expectation and variance for standard distributions.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; SymPy for symbolic probability computations; Jupyter Notebook; scikit-learn for exploratory data modelling.

Unit II: Probability Distributions:

Core Content: Binomial distribution: properties, mean and variance; Poisson distribution: properties, Poisson approximation to binomial; normal distribution: properties, standard normal curve, areas under normal curve; correlation coefficient; rank correlation; regression lines and regression coefficients.

AI Integration: SciPy-based computation and visualization of binomial, Poisson, and normal distributions; AI-assisted plotting of standard normal curve and computation of area probabilities; Python-based correlation and regression analysis on engineering data sets; use of AI tools to interpret regression coefficients and correlation strength.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib, pandas) on Google Colab; scikit-learn for regression and correlation analysis; Jupyter Notebook; WolframAlpha free tier; GNU Octave.

Unit III: Complex Functions and Analyticity: Complex Integration:

Core Content: Functions of a complex variable; limits and continuity; differentiability; analyticity; Cauchy-Riemann equations in Cartesian coordinates; Cauchy-Riemann equations in polar coordinates; harmonic functions; conjugate harmonic functions; Milne-Thomson method.

AI Integration: Python-based visualization of complex functions and their mappings; symbolic verification of Cauchy–Riemann equations using SymPy; AI-assisted plotting of harmonic and conjugate harmonic surfaces; use of ChatGPT/Copilot to explain analyticity and the Milne–Thomsonconstruction.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib, SymPy) on Google Colab; Jupyter Notebook; WolframAlpha free tier for verification; GNU Octave.

Unit IV: Complex Integration:

Core Content: Line integrals in the complex plane; Cauchy's integral theorem; Cauchy's integral formula; generalised Cauchy's integral formula; Liouville's theorem; maximum modulus theorem.

AI Integration: Numerical evaluation of complex line integrals using SciPy; AI-assisted verification of Cauchy's integral theorem results; visualization of contour paths in the complex plane using Matplotlib; use of AI tools to interpret Liouville's theorem and maximum modulus principle.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib, SymPy) on Google Colab; Jupyter Notebook; WolframAlpha free tier; GNU Octave.

Unit V: Series Expansions and Residues :

Core Content: Taylor's series; Laurent's series; zeros and singularities: isolated, removable, poles, essential; residues; Cauchy's residue theorem; evaluation of real definite integrals using the residue theorem.

AI Integration: SymPy-based Taylor and Laurent series generation for complex functions; AI-assisted classification of singularities and residue computation; Python visualization of convergence regions; numerical validation of definite integrals using SciPy and comparison with residue-based results.

Free/Open-Source AI Tools: Python (SymPy, NumPy, SciPy, Matplotlib) on Google Colab; Jupyter Notebook; WolframAlpha free tier for symbolic verification.

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26HMHS205T	HM	Managerial Economics and Financial Analysis (Common to all branches of Engineering)	2	0	0	0	2

Pre Requisites: Basic Mathematics & Engineering Economics concepts

Course Objectives:

- To understand fundamental concepts of managerial economics, demand analysis, and elasticity to make data-driven business decisions.
- To apply production and cost analysis techniques, including break-even analysis, to optimise organisational resource allocation.
- To analyse various forms of business organisations, market structures, and pricing strategies for competitive business environments.
- To evaluate capital budgeting proposals using NPV, IRR, ARR, and Payback methods for strategic investment decision-making.
- To prepare and interpret financial statements, compute key financial ratios, and employ AI/ML techniques for automated financial analysis.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Apply fundamental concepts of economics, including demand, supply, market structures, and the time value of money, to analyze and solve basic economic problems. (L3)

CO2: Apply economic theories of demand forecasting, cost analysis, and production functions to engineering project decision-making scenarios. (L3)

CO3: Analyse financial statements, cost-volume-profit relationships, and capital budgeting decisions using traditional and AI-powered financial tools. (L4)

CO4: Evaluate investment alternatives using NPV, IRR, and Payback Period methods and assess business viability under uncertainty using scenario analysis. (L5)

CO5: Create a comprehensive mini-project business plan incorporating market analysis, cost estimation, financial projections, and AI-assisted forecasting. (L6)

CO – PO Mapping

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1							1	1	2	3	1		
CO2							1	1	2	3	1		
CO3							1	2	2	3	1		
CO4							1	2	2	3	1		
CO5							1	3	3	3	1		

Unit I: Introduction to Managerial Economics:

Core Content: Managerial Economics — meaning, nature, scope, and significance for engineers. Economic Analysis: micro vs. macroeconomics; positive vs. normative economics. Demand Analysis — concept, determinants, demand function, law of demand. Elasticity of Demand — types, measurement, business applications. Demand Forecasting — meaning, need, methods.

AI Integration: Generate demand scenarios for an engineering product (e.g., solar panels) and interpret price elasticity, implement moving average and exponential smoothing for a sample sales dataset, use publicly available CMIE or RBI data; apply AI-assisted regression toforecast demand.

Free/Open-Source AI Tools: ChatGPT / Gemini (free tiers); Google Sheets + FORECAST function (free); Python (pandas, scikit-learn) on Google Colab (free); Wolfram Alpha (free

Unit II: Production and Cost Analysis:

Core Content: Production concepts and modern manufacturing systems. Production function — isoquants and isocosts; least-cost combination of inputs. Cost concepts — fixed, variable, total, average, marginal costs. Break-Even Analysis — concept, assumptions, applications; determination of Break-Even Point; margin of safety and profit planning (simple problems).

AI Integration: Build a BEA spreadsheet with dynamic charts, generate a cost function for a manufacturing scenario and identify optimal production level, collect cost data of a local small enterprise; perform AI-assisted CVP analysis and present findings, visualise cost curves.

Free/Open-Source AI Tools: Google Sheets (free); LibreOffice Calc (free); Python (Plotly, pandas) on Google Colab (free); ChatGPT / Gemini (free tiers); Wolfram Alpha (free)

Unit III: Business Organisations and Market Structures:

Core Content: Forms of Business Organisations — sole proprietary, partnership, joint stock companies, startups and digital enterprises. Public vs. private sector in digital economy. Market Structures — classification of markets with real-world examples. Pricing methods and strategies.

AI Integration: Simulate a duopoly pricing game and find Nash Equilibrium with AI assistance, Analyse pricing strategies of three competing tech products using online data and AI classification, how do AI algorithms determine prices and dynamic pricing in e-commerce.

Free/Open-Source AI Tools: ChatGPT / Gemini (free tiers); Google Sheets (free); Python (pandas, Matplotlib) on Google Colab (free)

Unit IV: Capital Budgeting:

Core Content: Capital — introduction, meaning, nature, and significance. Capital Budgeting — concept, nature, significance in modern enterprises, role in strategic decision-making. Methods — Payback Method, Accounting Rate of Return (ARR), Net Present Value (NPV), Internal Rate of Return (IRR), Profitability Index (PI).

AI Integration: Evaluate 3 capital investment alternatives, Monte Carlo simulation for capital budgeting risk analysis, AI-based working capital optimization using predictive models, decision tree analysis for investment appraisal.

Free/Open-Source AI Tools: Google Sheets (free); Python (NumPy, Matplotlib, scikit-learn) on Google Colab (free); ChatGPT / Gemini (free tiers); Wolfram Alpha (free)

Unit V: Financial Accounting and Analysis:

Core Content: Accounting principles and digital accounting systems. Journal, ledger, trial balance. Final Accounts — trading account, profit and loss account, balance sheet with simple adjustments. Financial Analysis — liquidity ratios, activity ratios, capital structure ratios, profitability ratios.

AI Integration: Automated financial statement, interpret a company's financial ratios from a pasted balance sheet and income statement, Machine learning for financial ratio prediction and company health assessment, download annual report of an Indian engineering company (BHEL, L&T, Infosys) and perform ratio analysis.

Free/Open-Source AI Tools: Python (pandas, Matplotlib) on Google Colab (free); Google Sheets (free); ChatGPT / Gemini (free tiers); Wolfram Alpha (free)

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26ES01101T	ES	**Sustainability and Green Engineering (AI Integrated)** (Common to all branches of Engineering)	2	0	0	0	2

Pre Requisites: Basic Environmental Science & Engineering Chemistry

Course Objectives:

- To understand the concepts of sustainability, carbon cycle, and the environmental impact of engineering activities.
- To evaluate sustainable construction materials, their life cycle, and environmental performance.
- To apply energy calculations for buildings including embodied energy, operational energy, and life cycle energy.
- To assess green building standards, energy codes (ECSBC), and performance rating systems (LEED, GRIHA).
- To integrate AI/ML tools for carbon footprint analysis, energy optimization, and sustainable design decision-making.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Analyze the principles of sustainability, Sustainable Development Goals (SDGs), carbon cycle, and greenhouse gas accounting to assess their interrelationships and environmental impacts. (L4)

CO2: Apply knowledge of sustainable construction materials including SCMs, recycled aggregates, geopolymer concrete, and alternative binders to evaluate their environmental performance.(L3)

CO3: Analyze the embodied energy and operational energy of building systems, perform energy calculations, and compare environmental performance of design alternatives.(L4)

CO4: Evaluate green building rating systems (LEED, GRIHA, ECBC), assess compliance with energy codes, and compare sustainability performance of different building design strategies.(L5)

CO5: Design sustainable civil engineering solutions integrating circular economy principles, C&D waste management, green infrastructure, and AI-driven optimization tools.(L6)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	2	1				3	2				2	1	1
CO2	2	2	2	2	2	2	2				2	1	1
CO3	2	2	2	2	3	2	1				2	1	1
CO4	2	2	3	2	3	3	2				3	1	1
CO5	2	3	3	3	3	3	2				3	2	2

Unit I: Fundamentals of Sustainability & Carbon Cycle:

Core Content: Definition of sustainability: three pillars (economic, social, environmental), Brundtland definition. Sustainable Development Goals (SDGs): SDGs 6, 7, 9, 11, 12, 13. Carbon cycle: biotic and abiotic components. Greenhouse gases: CO_2, CH_4, N_2O, HFCs. Carbon dioxide

equivalent (CO_2e). CO_2 contribution from cement production (~8% global emissions), steel, glass, aluminium. Carbon footprint: definition, calculation methodology, carbon accounting. Climate change: global warming, sea level rise, extreme events.

AI Integration: AI for carbon footprint tracking: overview of ML-based life cycle assessment tools. Python-based carbon footprint calculator: computing embodied carbon from material quantities. Introduction to climate modelling data processing using Python (pandas, matplotlib). Online tools: Global Carbon Atlas, openLCA (free) for life cycle assessment.

Free/Open-Source AI Tools: openLCA (free, open-source LCA software); Python (Pandas, Matplotlib) – Google Colab; Global Carbon Project tools; SimaPro (student trial)

Unit II: Sustainable Construction Materials:

Core Content: Construction materials and indoor air quality: VOCs, formaldehyde. No/low cement concrete: supplementary cementitious materials (fly ash, GGBS, silica fume, rice husk ash) — properties, mix proportions. Recycled aggregate concrete: sources, properties, durability. Alternative binders: alkali-activated materials (AAM), geopolymer concrete. Manufactured sand (M-sand): processing, quality. Bamboo, timber, and fibre-reinforced composites. Durability and service life assessment. Life cycle of construction materials.

AI Integration: ML for sustainable material selection: multi-criteria decision analysis using Python. AI-based prediction of concrete strength from mix proportions using regression models (scikit-learn). Computer vision for recycled aggregate quality assessment. Introduction to materials informatics: using ML to discover new sustainable binders. Comparative LCA using openLCA.

Free/Open-Source AI Tools: scikit-learn (free Python ML library); openLCA (free); Python (NumPy, scikit-learn) – Google Colab; Concrete Mixture Proportioner (free online NRMCA tool

Unit III: Embodied Energy & Operational Energy in Buildings:

Core Content: Definition of embodied energy: extraction, processing, manufacturing, transport, construction, demolition. Operational energy: heating, cooling, lighting, hot water. Life cycle energy: sum of embodied and operational energy. Calculation of embodied energy for common construction materials (energy intensity values). Embodied energy calculation for a simple building structure. Energy balance: reducing operational energy vs. increasing insulation (embodied energy trade-off).

AI Integration: Python-based embodied energy calculator for building elements. AI for building energy optimization: overview of EnergyPlus (free) and OpenStudio (free) simulations. ML for operational energy prediction from building parameters (Linear Regression, Random Forest using scikit-learn). Digital twin for energy monitoring: concept and tools. Building energy benchmarking using ML: comparison with national average.

Free/Open-Source AI Tools: EnergyPlus (free, US DOE); OpenStudio (free); Python (scikit-learn, NumPy) on Google Colab (free); openLCA (free); AI tools: ChatGPT / Gemini

Unit IV: Green Building Rating Systems & Energy Codes:

Core Content Energy Conservation and Sustainability Building Code (ECSBC-2023): scope, mandatory and prescriptive requirements, OTTV calculations, compliance path. Green building rating systems: LEED — credit categories, certification levels; GRIHA — India's national system; IGBC rating systems; BEE star rating. Passive design strategies: building orientation, natural ventilation, daylighting, cool roofs. Net Zero Energy Buildings (NZEB): definition, pathways.

AI Integration: AI for automated LEED/GRIHA compliance checking: overview of existing tools. ML for building performance prediction: predicting LEED score from building design parameters. BIM-based energy analysis: linking Revit model to energy simulation. Smart building systems: AI-driven HVAC optimization. IoT sensors for real-time energy monitoring. Case study: AI-optimized green building design.

Free/Open-Source AI Tools: EnergyPlus (free); OpenStudio (free); Autodesk Revit student version with Energy Analysis add-in (free); Python for data analysis (Google Colab)

Unit V: Circular Economy, Waste Management & Environmental Sustainability:

Core Content: Circular economy principles: reduce, reuse, recycle, recover, redesign — waste hierarchy. Construction and demolition (C&D) waste: types, quantities, recycling potential. C&D waste management rules 2016. Deconstruction vs. demolition. Industrial waste in construction: fly ash, blast furnace slag, quarry dust, plastic waste utilisation. Water recycling in construction. Green procurement policies. Carbon sequestration potential of green infrastructure: urban trees, green roofs, wetlands. Acid rain: causes, effects, prevention.

AI Integration: AI for construction waste prediction: ML models for waste generation estimation. Computer vision for C&D waste sorting (overview of automated sorting robots). Digital material passport: BIM-based end-of-life material tracking. ML for demolition waste characterization. Python for waste audit data analysis. Sustainable infrastructure planning using AI and GIS: overview of green infrastructure planning tools.

Free/Open-Source AI Tools: Python (scikit-learn, Pandas) – Google Colab; QGIS (free GIS for green infrastructure planning); OpenLCA (free LCA); i-Tree (free urban tree carbon quantification tool by USDA)

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26EC04202T	EC	Signals, Systems and Stochastic Processes	2	0	2	0	3

Pre Requisites: Engineering Mathematics, Network Analysis & Probability Theory

Course Objectives:

- To understand the classification and mathematical representation of continuous-time and discrete-time signals and systems, and analyse them using Fourier series and Fourier transform techniques.
- To Apply Laplace transform and its properties for system analysis, stability evaluation (BIBO), and transfer function determination.
- To Understand the sampling theorem, aliasing, and the behaviour of LTI systems including distortionless transmission and Paley-Wiener criterion.
- To analyse random processes with respect to stationarity, ergodicity, autocorrelation, cross-correlation, Gaussian, and Poisson processes.
- To Characterise random process spectral properties using power spectral density, cross-power density spectrum, and the Wiener-Khinchin theorem

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Classify signals and systems, perform signal operations, and represent periodic signals using Fourier series with discrete spectrum interpretation. (L3)

CO2: Compute Fourier and Laplace transforms, determine ROC and transfer functions, and evaluate BIBO stability of LTI systems. (L4)

CO3: Apply the sampling theorem to determine Nyquist rates, analyse aliasing effects, and characterise LTI system response and ideal filter properties. (L3)

CO4: Analyse random processes for stationarity, ergodicity, autocorrelation, and cross-correlation including Gaussian and Poisson process models. (L4)

CO5: Compute power spectral density and cross-power density spectra using the Wiener-Khinchin theorem and determine spectral characteristics of system responses.(L4)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	2	1	2	2		1				1	3	2
CO2	3	3	2	2	2		1				2	3	2
CO3	3	3	2	2	2		1				2	3	3
CO4	3	2	1	2	2		1				1	3	2
CO5	3	3	2	2	3		1				2	3	3

Unit I: Signals & Systems:

Core Content: Basic definitions and classification of signals and systems (continuous-time and discrete-time), operations on signals, concepts of convolution and correlation of signals, analogy between vectors and signals — orthogonality, mean square error. Fourier series: trigonometric and exponential forms, properties, concept of discrete spectrum, illustrative problems.

AI Integration: Use AI/LLM tools to explain signal classification and walk through a discrete convolution sum step by step; plot basic signals and applies time-shifting and scaling operations. compute the first three Fourier coefficients of a square wave using AI tools, sketch the partial reconstruction, and verify convergence.
Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Signals & Systems lectures.

Unit II: Fourier Transform & Laplace Transform:
Core Content: Fourier Transform: Definition, computation and properties for different types of signals and systems, inverse Fourier transform. Laplace Transform: Definition, region of convergence (ROC), properties, inverse Laplace transforms, the s-plane and BIBO stability, transfer functions, system response to standard signals, illustrative problems.
AI Integration: Use AI/LLM tools to explain Fourier transform properties and the ROC concept, showing how pole locations determine BIBO stability; compute the Fourier transform of a rectangular pulse and shows how spectrum bandwidth changes with pulse width, verifying time-frequency duality.
Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL lectures.

Unit III: Sampling & Signal Transmission through Linear Systems:
Core Content: Sampling theorem — analytical proof for band-limited signals, reconstruction of signal from its samples, effect of under-sampling — aliasing, illustrative problems. Signal Transmission through Linear Systems: linear system, impulse response, response of a linear system for different input signals, LTI and LTV systems, transfer function of an LTI system; ideal LPF, HPF and BPF characteristics, distortionless transmission, bandwidth concepts, causality and Paley-Wiener criterion for physical realization.
AI Integration: Use AI/LLM tools to explain the sampling theorem and aliasing with a 1 kHz sine wave example at different sampling rates; sketch spectra and identify aliased frequencies. sample a signal below and above the Nyquist rate for visual observation of aliasing; explain distortionless transmission and the Paley-Wiener criterion.
Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini.

Unit IV: Random Processes – Temporal Characteristics:
Core Content: The random process concept, classification of processes, deterministic and non-deterministic processes, distribution and density functions, stationarity and statistical independence. First-order stationary processes, second-order and wide-sense stationarity, time averages and ergodicity, autocorrelation function and its properties, cross-correlation function and its properties, covariance functions, Gaussian random processes, Poisson random process. Mean and mean-squared value of system response, autocorrelation function of response, cross-correlation functions of input and output.

AI Integration: Use AI/LLM tools to explain stationarity and ergodicity using analogies and compare WSS and SSS processes with examples; simulate a Gaussian random process and compares sample statistics with theoretical values. cover key autocorrelation properties and work through a numerical autocorrelation example for a WSS process.
Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini.

Unit V: Random Processes – Spectral Characteristics:
Core Content: The power spectrum: properties, relationship between power spectrum and autocorrelation function, the cross-power density spectrum — properties, relationship between cross-power spectrum and cross-correlation function. Spectral characteristics of system response: power density spectrum of response, cross-power density spectra of input and output.
AI Integration: Use AI/LLM tools to explain PSD and the Wiener-Khinchin theorem; sketch and compare PSD of white noise vs. a band-limited signal. compute PSD using FFT and verifies it against the Fourier transform of the autocorrelation function, confirming the Wiener-Khinchin relationship numerically.
Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL lectures.

4. Hsu H., Schaum's Outline of Signals and Systems, 4th Edition, TMH, 2019.

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04201T	PC	Electronic Devices and Circuits	2	0	2	0	3

Pre Requisites: Physics for Communication Systems, Network Analysis & Engineering Mathematics

Course Objectives:

- To understand the construction, operating principles and V-I characteristics of PN junction diode and special diodes.
- To analyse BJT characteristics in various configurations and understand biasing techniques.
- To analyse BJT small signal operation and models.
- To understand JFET and MOSFET device structures, V-I characteristics and biasing methods.
- To analyse MOSFET small-signal models and single-stage MOS amplifier configurations

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Analyse PN junction diode characteristics, design rectifiers, clipping and clamping circuits, and describe the operation of special diodes.(L4)

CO2: Apply BJT biasing techniques to establish a stable Q-point, analyse DC/AC load lines, and evaluate thermal stability.(L3)

CO3: Apply BJT Hybrid-π and T-models to compute voltage gain and input/output impedance of single-stage amplifiers.(L3)

CO4: Analyse JFET and MOSFET V-I characteristics, evaluate different biasing methods, and design MOSFET circuits for amplification and switching.(L4)

CO5: Apply MOSFET small-signal models to determine gain and impedance of CS, CG, and source follower configurations and compare their performance.(L3)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	2		1		2		1	3	2
CO2	3	3	2	2	2		1		1		1	3	2
CO3	3	3	2	2	2		1		1		2	3	2
CO4	3	3	2	2	2		1		1		1	3	3
CO5	3	3	3	2	2		1		2		2	3	3

Unit I: PN Junction Diode & Special Diodes:

Core Content:PN junction diode V-I characteristics, PN diode current equation, diode resistance, transition and diffusion capacitance, effect of temperature on PN junction diode. Half-wave, full-wave and bridge rectifiers with and without filters, ripple factor and regulation

characteristics. Zener and avalanche breakdowns, V-I characteristics of Zener diode, Zener diode as voltage regulator, clipping and clamping circuits, illustrative problems. Special Diodes: Construction, operation and V-I characteristics of tunnel diode, LED, photo diode and UJT.

AI Integration: Use AI/LLM tools (ChatGPT/Gemini) to explain the diode current equation, compare rectifiers (ripple factor, efficiency), and describe clipping/clamping circuits with waveform sketches. Plot the Shockley I-V curve in Python (Google Colab) varying temperature, and prepare a comparison table of special diodes (LED, photodiode, tunnel diode, UJT) covering structure, working principle, and applications.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; Falstad Circuit Simulator; ChatGPT / Gemini

Unit II: BJT Characteristics, Biasing & Stabilization:

Core Content: Review of bipolar junction transistors, characteristics, transistor as an amplifier and as a switch, BJT configurations, limits of operation, BJT specifications. Biasing and Stabilization: operating point, DC and AC load lines, importance of biasing, fixed bias, collector-to-base bias, self-bias, bias stability, thermal runaway, thermal stability, illustrative problems.

AI Integration: Use AI/LLM tools to explain CE, CB, and CC configurations, find the Q-point for a fixed bias circuit, and compare fixed bias, collector-to-base bias, and self-bias in a table covering stability factor and Q-point stability. Plot the DC load line and Q-point in Python (Google Colab), varying the collector resistor to observe Q-point shift.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; Falstad Circuit Simulator; ChatGPT / Gemini

Unit III: BJT Small Signal Operation and Models:

Core Content: Transconductance, input resistance at the base and emitter, voltage gain, separating signal and DC quantities, the Hybrid-π model, the T model. Single stage BJT amplifiers: common-emitter (CE) amplifier without and with emitter resistance, common-base (CB) amplifier, common-collector (CC) amplifier, problem solving.

AI Integration: Use AI/LLM tools to derive voltage gain for CE, CB, and CC amplifiers using the Hybrid-π and T-models, and compare the three configurations in a table showing gain, input resistance, and output resistance. Verify results using a Python (Google Colab) template for given gm and rπ values.

Free/Open-Source AI Tools: Python (NumPy) on Google Colab; ChatGPT / Gemini; NPTEL Microelectronics lectures

Unit IV: FET & MOSFET:

Core Content: Junction Field Effect Transistor (JFET): construction, principle of operation, V-I characteristics, comparison of BJT and FET, FET as voltage variable resistor. MOS Field Effect Transistors: introduction, device structure and physical operation, CMOS, V-I characteristics, MOSFET circuits at DC, MOSFET as an amplifier and as a switch. Biasing in MOS amplifier circuits — biasing by fixing VGS with and without source resistance, biasing using drain-to-gate feedback resistor, problem solving.

AI Integration: Use AI/LLM tools to compare JFET and MOSFET (structure, control mechanism, biasing) and explain MOSFET biasing methods step by step. Plot MOSFET ID-VDS curves for three VGS values using the square-law model in Python (Google Colab), marking triode, saturation, and cutoff regions.
Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini

Unit V: FET & MOSFET:
Core Content: DC bias, separating DC analysis and signal analysis, small signal equivalent circuit models, transconductance, the T equivalent circuit model. Single stage MOS amplifiers: common source (CS) amplifier without and with source resistance, common gate (CG) amplifier, source follower, problem solving.
AI Integration: Use AI/LLM tools to derive voltage gain for CS, CG, and source follower configurations and compare them in a table showing gain, input/output resistance, and best-fit applications. Compute parameters in Python (Google Colab) for given gm and rd values, and explain the role of coupling and bypass capacitors in separating DC and AC analysis.
Free/Open-Source AI Tools: Python (NumPy) on Google Colab; ChatGPT / Gemini; NPTEL Microelectronics lectures

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04202T	PC	Digital Circuits Design	2	0	2	0	3

Pre Requisites: Engineering Mathematics

Course Objectives:

- To understand number systems, Boolean algebra laws, and minimisation of Boolean functions using Karnaugh maps for logic circuit design.
- To design and verify combinational logic circuits including arithmetic circuits, data routing circuits, code converters, and parity circuits.
- To understand and apply Verilog HDL for structural, dataflow, and behavioural description of combinational and sequential digital circuits.
- To analyse and design sequential logic circuits including flip-flops, counters, and shift registers using state diagrams and excitation tables.
- To design Finite State Machines for sequence detection and understand the structure and advantages of PLDs and FPGAs.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Apply number systems, binary codes, Boolean algebra, and De Morgan's theorems to represent, convert, and simplify digital logic functions in SOP and POS forms. (L3)

CO2: Minimise Boolean functions using K-maps with don't-care conditions; identify prime implicants and implement using NAND-only and NOR-only gate networks. (L3)

CO3: Design combinational circuits — arithmetic units, code converters, MUX/DEMUX, encoders, and decoders; model and simulate using Verilog/VHDL. (L3)

CO4: Design sequential circuits — flip-flops, shift registers, and counters; develop HDL behavioural models and test benches for simulation. (L3)

CO5: Design synchronous sequential circuits using Mealy and Moore models; implement on PLA, PAL, CPLD, and FPGA platforms using HDL. (L3)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	1	2		1				1	3	2
CO2	3	3	2	2	2		1				1	3	2
CO3	3	3	3	2	3		1				2	3	3
CO4	3	3	2	2	3		1				2	3	3
CO5	3	3	3	2	3		1				2	3	3

Unit I: Number Systems, Codes & Boolean Algebra:

Core Content: Binary, octal, decimal, and hexadecimal number systems, number conversions, binary arithmetic, signed binary numbers, 1's and 2's complements. BCD, Gray, Excess-3, and ASCII codes. Boolean algebra postulates and theorems, De Morgan's theorems, Boolean functions, SOP and POS forms, canonical forms, and algebraic minimization.

AI Integration: Students use AI/LLM tools to solve and verify number conversions and signed binary arithmetic problems. A Python (Google Colab) template is used to convert decimal to binary/octal/hex and compare canonical SOP, POS, and simplified Boolean expressions.

Free/Open-Source AI Tools: Python (NumPy, SymPy) on Google Colab; Logisim; online Boolean calculators; ChatGPT / Gemini

Unit II: Logic Gates & Gate Level Minimisation:

Core Content: AND, OR, NOT, NAND, NOR, XOR, and XNOR gates — truth tables, logic symbols, and Boolean expressions; gate-level realisation of Boolean expressions. Karnaugh map minimization for 2-variable, 3-variable, 4-variable, and 5-variable functions; SOP and POS minimization with don't-care conditions; prime implicants and essential prime implicants; NAND-only and NOR-only implementations of minimized expressions.

AI Integration: Students use AI/LLM tools to understand prime implicants and NAND/NOR-only implementations through worked examples. A Python K-map template auto-groups minterms and verifies minimized SOP expressions against manual solutions.

Free/Open-Source AI Tools: Python (NumPy) on Google Colab; Logisim; K-map solver tools online; ChatGPT / Gemini

Unit III: Combinational Circuits:

Core Content: Half adder, full adder, half subtractor, full subtractor, parallel binary adder, BCD adder, magnitude comparator, BCD to Excess-3 converter, binary to Gray converter, multiplexers, demultiplexers, encoders, and decoders. Introduction to HDL, Verilog/VHDL basics, dataflow and behavioural modelling; HDL programs for logic gates, adders, multiplexers, decoders, and code converters.

AI Integration: Students use AI/LLM tools to derive adder and BCD adder logic and to write and trace a Verilog program for a BCD-to-Excess-3 converter. A 4-to-1 MUX and 2-to-4 decoder are simulated in Python (Google Colab) to verify Boolean function implementation.

Free/Open-Source AI Tools: Python (NumPy) on Google Colab; Logisim; EDA Playground (free Verilog simulation); ChatGPT / Gemini

Unit IV: Sequential Circuits:

Core Content: SR latch, D latch, SR, JK, D, and T flip-flops, master-slave flip-flops, and flip-flop conversions. SISO, SIPO, PISO, PIPO, and universal shift registers. Asynchronous counters, synchronous counters, up/down counters, modulo-N counters, ring counters, and Johnson counters. HDL modelling of flip-flops, registers, counters, and test bench development.

AI Integration: Students use AI/LLM tools to work through flip-flop excitation tables and JK-to-D conversion, then write a Verilog behavioural model with test bench for a JK flip-flop and ring counter. A 4-bit synchronous up-counter and SIPO shift register are simulated in Python to verify state sequences.

Free/Open-Source AI Tools: Python (NumPy) on Google Colab; Logisim; EDA Playground (free Verilog simulation); ChatGPT / Gemini

Unit V: Sequential Design & Programmable Logic Devices:

Core Content: State diagrams, state tables, state assignment, design of synchronous sequential circuits, Mealy and Moore sequence detectors. HDL implementation of sequence detectors, finite state machines, and simple ALU design. PLA, PAL, PROM, and FPGA — structure, programming tables, and implementation.

AI Integration: Students use AI/LLM tools to design a '1011' sequence detector as both Mealy and Moore machines and compare PLA, PAL, PROM, and FPGA architectures. A Verilog FSM for a sequence detector and a basic ALU are written, with exposure to the FPGA design flow from HDL to bitstream.

Free/Open-Source AI Tools: Python on Google Colab; EDA Playground; Intel Quartus Prime Lite / Xilinx Vivado (free); ChatGPT / Gemini

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26EC04202P	EC	Signals & Systems Lab	0	0	0	2	1

Pre Requisites: Engineering Mathematics, Network Analysis & Probability Theory

Course Objectives:

- To introduce signal and system concepts including transforms, LTI properties, stability, and filter response techniques using MATLAB/Simulink or Python.
- To develop understanding of frequency-domain analysis through Fourier series, Fourier transforms, and spectral interpretation of continuous and discrete-time signals.
- To familiarise students with sampling theory, noise analysis, and correlation-based techniques for signal processing and system characterisation.
- To enable students to design, simulate, and verify system properties such as linearity, time-invariance, causality, and stability using MATLAB/Simulink.
- To familiarise students with ML-based approaches and LLM tools for signal classification, system identification, parameter estimation, and automated analysis.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Simulate and analyse continuous and discrete-time signals using MATLAB/Python; apply signal operations, transforms, and spectral analysis to characterise signal properties. (L3)

CO2: Verify LTI system properties, stability, and causality through impulse/step response analysis and pole-zero diagrams using MATLAB/Simulink. (L4)

CO3: Evaluate system performance using frequency-domain analysis, sampling theory, noise characterisation, and correlation-based noise reduction techniques. (L4)

CO4: Design and simulate filter responses, random signal generation, and amplification systems using MATLAB/Simulink, validating results against theoretical expectations.(L5)

CO5: Build and apply ML classifiers and regression models using Python/Scikit-learn to automate signal classification, system identification, aliasing detection, and parameter estimation, leveraging LLM tools for result interpretation.(L5)

CO – PO Mapping: Scale: 3 – Strong, 2 – Moderate, 1 – Slight

CO5	2	3	3	1	3		3	3	3		3	3	3

List of Experiments:

Part A – Regular Experiments

1. Write a program to generate various Signals and Sequences: Periodic and Aperiodic, Unit Impulse, Unit Step, Square, Sawtooth, Triangular, Sinusoidal, Ramp, and Sinc function.
2. Perform operations on Signals and Sequences: Addition, Multiplication, Scaling, Shifting, Folding, Computation of Energy and Average Power.
3. Write a program to find the trigonometric and exponential Fourier series coefficients of a rectangular periodic signal. Reconstruct the signal by combining the Fourier series coefficients with appropriate weightings and plot the discrete spectrum of the signal.
4. Write a program to find the Fourier Transform of a given signal. Plot its amplitude and phase spectrum.
5. Write a program to convolve two discrete-time sequences. Plot all the sequences.
6. Write a program to find autocorrelation and cross-correlation of given sequences.
7. Write a program in MATLAB and/or Simulink to verify Linearity and Time Invariance properties of a given Continuous System.
8. Write a program in MATLAB and/or Simulink to generate a discrete-time sequence by sampling a continuous-time signal. Show that with sampling rates less than the Nyquist rate, aliasing occurs while reconstructing the signal.
9. Write a program in MATLAB and/or Simulink to find the magnitude and phase response of a first-order Low Pass and High Pass filter. Plot the responses in logarithmic scale.
10. Write a program to generate Complex Gaussian noise and find its mean, variance, Probability Density Function (PDF) and Power Spectral Density (PSD).
11. Generate Random data (with bipolar) for a given data rate (say 10 kbps). Plot the same for a time period of 0.2 sec.
12. Write a program to plot the pole-zero diagram in the S-plane for a given signal/sequence and verify its stability.
13. Write a program in MATLAB and/or Simulink to find the impulse response and step response of a system from its difference equation.
14. Write a program to remove noise by autocorrelation/cross-correlation in a given signal corrupted by noise.
15. Build a system that amplifies a sine wave by a factor of two using Simulink.
16. Test the linearity of the system using Simulink.

Note: Implement / execute any 12 experiments. All experiments are to be simulated using MATLAB or equivalent software.

Part B – AI / LLM and Python / MATLAB Tasks

Experiment 1 – Signal Generation & Classification

- Use AI/LLM tools to classify the generated signals as periodic/aperiodic and even/odd, and explain signal properties with examples.
- Train a KNN classifier (Scikit-learn) using extracted features (mean, variance) to automatically classify the signal type.

Experiment 2 – Signal Operations

- Use AI/LLM tools to predict the output of each operation before simulation and provide a conceptual explanation of the transformations.
- Use Linear Regression to approximate the transformed signal values and compare with the simulated output.

Experiment 3 – Fourier Series

- Use AI/LLM tools to give a step-by-step explanation of the Fourier series derivation and interpret the discrete spectrum.
- Train a regression model to predict peak amplitude or output signal length as a function of the number of harmonics included.

Experiment 4 – Fourier Transform

- Use AI/LLM tools to interpret spectral similarity or dissimilarity between two signals based on their amplitude and phase spectra.
- Train a binary classifier to detect whether two signals are similar or dissimilar based on their spectral features.

Experiment 5 – Convolution

- Use AI/LLM tools to explain the harmonic contribution of each input sequence to the convolution output.
- Build a regression model to predict reconstruction error as a function of the number of harmonics used.

Experiment 6 – Correlation

- Use AI/LLM tools to interpret frequency components and explain the significance of peaks in the correlation output.
- Train a classification model to identify the signal type from its correlation-based spectrum features.

Experiment 7 – LTI Properties

- Use AI/LLM tools to verify and explain whether the system satisfies superposition and homogeneity, and reason about LTI properties.
- Train a Decision Tree classifier to classify the system as LTI or Non-LTI based on input-output data pairs.

Experiment 8 – Sampling & Aliasing

- Use AI/LLM tools to predict aliasing conditions and explain the implications of the Nyquist sampling theorem.
- Build a binary classifier (Logistic Regression) to detect aliasing from sampling rate and signal frequency parameters.

Experiment 9 – Filter Response

- Use AI/LLM tools to predict and explain filter response behaviour, including cutoff frequency and bandwidth characteristics.
- Train a regression model to estimate the cutoff frequency from filter design parameters.

Experiment 10 – Gaussian Noise

- Use AI/LLM tools to explain the statistical properties of Gaussian noise, the significance of PSD, and the interpretation of the PDF.
- Apply a Gaussian Naive Bayes classifier to identify the distribution type from computed statistical features.

Experiment 11 – Random Bipolar Data

- Use AI/LLM tools to explain the statistical and spectral properties of bipolar random data and their significance in digital communications.

- Apply a Gaussian Naive Bayes classifier to identify the distribution type of the generated random data.

Experiment 12 – Pole-Zero & Stability

- Use AI/LLM tools to suggest an appropriate filtering technique based on the pole-zero locations and stability analysis.
- Build a simple denoising model using Linear Regression or ML-based Moving Average tuning to reduce noise.

Experiment 13 – Impulse & Step Response

- Use AI/LLM tools to explain the relationship between the difference equation and the system response (impulse & step), including stability and causality interpretation.
- Train a regression model (Linear Regression / MLP Regressor) to predict the impulse or step response values based on input coefficients.

Experiment 14 – Noise Removal

- Use AI/LLM tools to explain how autocorrelation and cross-correlation help in identifying useful signal components and reducing noise.
- Train a regression model (Linear Regression / Ridge Regression) to estimate the clean signal from a noisy input, or use a basic denoising autoencoder.

Experiment 15 – Sine Wave Amplification (Simulink)

- Use AI/LLM tools to predict and explain the effect of amplification (gain = 2) on amplitude, power, and frequency characteristics of the sine wave.
- Train a regression model to learn the relationship between input amplitude and output amplitude (gain modeling).

Experiment 16 – Linearity Test (Simulink)

- Use AI/LLM tools to verify and explain whether the system satisfies superposition and homogeneity conditions for various test inputs.
- Train a binary classification model (Logistic Regression / Decision Tree) to classify the system as Linear or Non-Linear based on input-output data.

Note: Any six experiments need to be implemented using appropriate AI/LLM tools and/or Python/MATLAB-based simulations.

Recommended Tools & Platforms

- MATLAB / Simulink – Signal generation, LTI verification, filter response, sampling, Simulink-based amplification and linearity testing
- Python (NumPy, SciPy, Matplotlib, Scikit-learn) on Google Colab (free) – signal processing, ML classification and regression models
- ChatGPT / Claude.ai / Gemini – LLM-based conceptual explanation, result interpretation, and prediction of system behaviour
- Scikit-learn (free, open-source) – KNN, Decision Tree, Logistic Regression, Linear/Ridge Regression, MLP Regressor, Gaussian Naive Bayes
- LibreOffice Calc (free, open-source) – standardised data recording templates for all experiments

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04201P	EC	Electronic Devices and Circuits Lab	0	0	0	3	1.5

Pre Requisites: Physics for Communication Systems, Network Analysis & Engineering Mathematics

Course Objectives:

- To introduce V-I and transfer characteristics of diodes (PN junction, Zener), UJT, BJT, JFET, and MOSFET, and the methods to extract device parameters from experimental data.
- To develop understanding of rectifier circuits (half wave and full wave), clipping and clamping circuits, and their performance metrics such as ripple factor and efficiency.
- To enable students to design and analyse biasing networks (voltage-divider bias, self-bias) for BJT and MOSFET, and determine the stable Q-point for linear amplifier operation.
- To familiarise students with the design and frequency response analysis of small signal amplifiers using BJT (CE) and MOSFET (CS), including RC coupled amplifier configurations.
- To familiarise students with LLM-based circuit interpretation and ML/Python techniques for device parameter estimation, operating point prediction, and performance curve analysis.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Plot and interpret V-I and transfer characteristics of PN junction diode, Zener diode, UJT, BJT, JFET, and MOSFET; extract device parameters such as β, α, IDSS, Vp, Vth, η, Ip, and Iv from experimental curves. (L3)

CO2: Analyse rectifier circuits and waveform shaping circuits (clippers and clampers), measuring ripple factor, efficiency, and output waveform accuracy for different configurations. (L4)

CO3: Design and evaluate BJT and MOSFET biasing networks (voltage-divider bias and self-bias), determine the DC load line and Q-point, and assess the stability of the operating point. (L4)

CO4: Design small signal amplifiers using BJT (CE) and MOSFET (CS), plot and interpret the frequency response (Bode plot), and determine bandwidth, midband gain, and gain-bandwidth product. (L5)

CO5: Apply ML regression models and classifiers using Python/Scikit-learn to fit device equations, predict operating points, estimate circuit parameters, and automate characteristic curve analysis, leveraging LLM tools for conceptual interpretation. (L5)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	**3**	**2**	**2**	**1**	**2**	**1**	**3**	**3**	**3**		**1**	**3**	**2**
CO2	**3**	**3**	**2**	**1**	**2**	**1**	**3**	**3**	**3**		**2**	**3**	**2**
CO3	**3**	**3**	**3**	**1**	**2**	**1**	**3**	**3**	**3**		**2**	**3**	**3**
CO4	**3**	**2**	**3**	**1**	**3**	**1**	**3**	**3**	**3**		**2**	**3**	**3**
CO5	**2**	**3**	**3**	**1**	**3**	**1**	**3**	**3**	**3**		**3**	**2**	**3**

List of Experiments

Part A – Regular Experiments

1. Plot V-I characteristics of a PN Junction diode.
2. Plot V-I characteristics of a Zener Diode and demonstrate its application as a Voltage Regulator.
3. Implement half wave and full wave rectifiers, observe the output waveforms, and analyse the ripple factor and efficiency.
4. Verify various clipping and clamper circuits using a PN junction diode and draw suitable graphs for each configuration.
5. Draw the V-I characteristics of a Unijunction Transistor (UJT) and determine the parameters η, Ip, Iv, Vp, and Vv.
6. Verify the input and output characteristics of a BJT in Common Emitter (CE) configuration and determine required parameters from the graphs.
7. Verify the input and output characteristics of a BJT in Common Base (CB) configuration and determine required parameters from the graphs.
8. Draw the V-I characteristics of a Junction Field Effect Transistor (JFET) and extract key parameters.
9. Draw the output and transfer characteristics of a MOSFET (Enhancement mode and Depletion mode) in CS configuration and determine required parameters from the graphs.
10. Design and analyse a voltage-divider bias / self-bias circuit using BJT and determine the Q-point.
11. Design and analyse a self-bias circuit using MOSFET and determine the operating point.
12. Design a small signal amplifier using MOSFET (common source) for given specifications. Draw the frequency response and find the bandwidth.
13. Design a small signal amplifier using BJT (common emitter) for given specifications. Draw the frequency response and find the bandwidth.
14. Design and analyse an RC coupled amplifier for given design parameters and determine its frequency response.

Note: Implement / execute any 12 experiments.

Part B – AI / LLM and Python / MATLAB Tasks

Experiment 1 – PN Junction Diode V-I Characteristics

- Use AI/LLM tools to interpret the forward bias, reverse bias, and breakdown regions of the V-I curve and explain the significance of threshold voltage and reverse saturation current.
- Train a regression model to fit the diode equation (Shockley equation) to the measured V-I data and estimate saturation current and ideality factor.

Experiment 2 – Zener Diode Characteristics & Voltage Regulator

- Use AI/LLM tools to explain Zener breakdown mechanism, the difference between avalanche and Zener breakdown, and how the diode maintains voltage regulation.
- Build a regression model to predict regulation performance (output voltage vs. load current) from measured characteristic data.

Experiment 3 – Half Wave & Full Wave Rectifiers

- Use AI/LLM tools to explain the working principle of half wave and full wave rectifiers, the role of the filter capacitor, and derive expressions for ripple factor and efficiency.
- Use Python/MATLAB simulation to predict ripple voltage and efficiency; apply regression to model ripple factor as a function of load and capacitance.

Experiment 4 – Clipping & Clamping Circuits

- Use AI/LLM tools to predict the output waveform shape for each clipping and clamping configuration before hardware verification, and explain the role of diode polarity and reference voltage.
- Train a binary classifier to identify the circuit type (clipper/clamper, positive/negative) from the output waveform features.

Experiment 5 – UJT Characteristics

- Use AI/LLM tools to explain the UJT structure, intrinsic standoff ratio, and the significance of the peak and valley points in the V-I characteristics.
- Apply curve fitting (polynomial regression) to the V-I data to accurately estimate the parameters η, Ip, Iv, Vp, and Vv.

Experiment 6 – BJT CE Characteristics

- Use AI/LLM tools to explain the physical basis of CE input/output characteristics, the concept of current gain β, and the Early effect.
- Train a regression model on the output characteristic data to estimate the current gain β and output resistance from the measured curves.

Experiment 7 – BJT CB Characteristics

- Use AI/LLM tools to explain CB configuration characteristics, compare them with CE configuration, and reason about the low input impedance and near-unity current gain of CB.
- Build a regression or parameter prediction model to estimate α, input resistance, and output resistance from CB characteristic data.

Experiment 8 – JFET Characteristics

- Use AI/LLM tools to explain the I-V behaviour of JFET in the ohmic, saturation, and pinch-off regions, and the significance of IDSS and Vp.
- Apply regression to model the drain current as a function of VGS and VDS, and estimate key JFET parameters.

Experiment 9 – MOSFET Characteristics (Enhancement & Depletion)

- Use AI/LLM tools to explain the differences between enhancement and depletion mode MOSFETs, the concept of threshold voltage, and the body effect.
- Train a regression/classification model to predict the threshold voltage from transfer characteristic data points.

Experiment 10 – BJT Voltage-Divider Bias / Q-Point

- Use AI/LLM tools to explain the voltage divider bias technique, DC load line concept, and how the Q-point ensures linear amplifier operation.
- Build a simple ML-based Q-point predictor that estimates ICQ and VCEQ from circuit component values.

Experiment 11 – MOSFET Self-Bias Operating Point

- Use AI/LLM tools to explain MOSFET self-bias operation, the role of the source resistor in stabilising the operating point, and compare with BJT biasing.
- Train a regression model to predict the MOSFET operating point (IDQ, VDSQ) from component values and MOSFET parameters.

Experiment 12 – MOSFET Common Source Amplifier

- Use AI/LLM tools to explain gain-bandwidth trade-off in MOSFET amplifiers, the effect of coupling and bypass capacitors on frequency response, and the concept of −3 dB bandwidth.
- Apply regression to model and predict the gain-bandwidth product from design parameters such as gm, RD, and capacitor values.

Experiment 13 – BJT Common Emitter Amplifier

- Use AI/LLM tools to analyse the BJT CE amplifier frequency response, explain low-frequency and high-frequency cutoff causes, and interpret the Bode plot.
- Use curve fitting (polynomial or spline regression) to model the frequency response and estimate the 3 dB bandwidth automatically from simulation data.

Experiment 14 – RC Coupled Amplifier

- Use AI/LLM tools to explain RC coupling, the purpose of coupling and bypass capacitors, inter-stage loading effects, and how they shape the frequency response.
- Combine LLM-guided design with a regression/optimisation model to predict midband gain and bandwidth for different RC values, enabling design optimisation.

Note: Any six experiments need to be implemented using appropriate AI/LLM tools and/or Python/MATLAB-based simulations. The suggested AI/LLM and/or Python/MATLAB tasks can be modified based on the decision of the subject expert.

AI Integration: AI/ML integration is embedded across all 14 experiments in two tiers: (i) AI/LLM tools (ChatGPT, Claude.ai, Gemini) provide conceptual interpretation of device characteristics, circuit behaviour prediction, and Bode plot analysis – bridging theory with observation; (ii) Python/Scikit-learn ML models (Shockley equation regression, polynomial curve fitting, binary classifiers, Q-point predictors, gain-bandwidth regression, spline/polynomial frequency response fitting) are applied to measured or simulated data to automate parameter extraction, operating point estimation, and performance prediction. Any six of the fourteen AI/ML task pairs must be completed, at the subject expert's discretion.

Software Tools: Multisim / PSpice or equivalent; Python (NumPy, SciPy, Matplotlib, Scikit-learn) – Google Colab (free); ChatGPT / Claude.ai / Gemini – LLM assistance.

Recommended Tools & Platforms

- Multisim / PSpice / LTspice – circuit simulation for V-I characteristics, rectifiers, clippers, biasing circuits, and amplifier frequency response
- Python (NumPy, SciPy, Matplotlib, Scikit-learn) on Google Colab (free) – Shockley regression, Q-point ML predictor, waveform classifier, bandwidth estimation
- ChatGPT / Claude.ai / Gemini – LLM-based conceptual interpretation of device characteristics, circuit behaviour prediction, and Bode plot analysis
- Scikit-learn (free, open-source) – polynomial regression, binary classifiers, Linear/Ridge Regression, MLP Regressor for device parameter estimation
- LibreOffice Calc (free, open-source) – standardised data recording templates, graph plotting for all experiments

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04202P	PC	Digital Circuits Design Lab	0	0	0	3	1.5

Pre Requisites: Engineering Mathematics

Course Objectives:

- To introduce the design and verification of basic and universal logic gates, and combinational digital circuits including adders, comparators, code converters, decoders, and multiplexers.
- To develop understanding of Boolean minimisation techniques (K-map, SOP/POS) and their application in realising efficient combinational logic circuits.
- To enable students to design and verify sequential circuits including flip flops (SR, JK, D), counters (ripple and synchronous), shift registers, and ring counters using truth tables, state diagrams, and excitation tables.
- To familiarise students with Verilog HDL for digital system design and simulation using EDA tools such as ModelSim or Vivado.
- To familiarise students with LLM tools for truth table generation, logic derivation, and Verilog debugging, and Python/ML techniques for state prediction, waveform verification, and Boolean minimisation automation.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Design and verify combinational circuits including logic gates, full adder, comparator, decoder, multiplexer, and code converters by applying Boolean algebra, truth tables, and K-map minimisation techniques.(L3)

CO2: Analyse and verify sequential circuits including SR, JK, and D flip flops, ring counters, shift registers, and MOD-8 ripple and synchronous counters, relating hardware behaviour to state diagrams, excitation tables, and timing diagrams. (L4)

CO3: Apply Karnaugh Map minimisation and excitation table methods to derive minimal logic expressions and flip flop input equations for the design of synchronous sequential circuits. (L4)

CO4: Design and simulate digital systems using Verilog HDL in ModelSim or Vivado, verify RTL structure, and interpret simulation waveforms against expected functional behaviour. (L3)

CO5: Use AI/LLM tools for truth table generation, logic derivation, and Verilog debugging, and Python/Scikit-learn models to automate Boolean minimisation, predict sequential circuit states, verify waveforms, and replicate digital logic using classifiers. (L3)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2

List of Experiments

Part A – Regular Experiments

1. Verify the operation of Basic Gates (AND, OR, NOT) and Universal Gates (NAND, NOR) using their respective Truth Tables.
2. Design a simple combinational circuit with four variables, obtain the minimal SOP expression using Karnaugh Map, and verify the truth table using a Digital Trainer Kit.
3. Verify the functional table of a 3-to-8 line Decoder / Demultiplexer IC.
4. Implement a four-variable logic function using an 8-to-1 Multiplexer and verify the output.
5. Design a full adder circuit using logic gates and verify its functional table.
6. Verify the Truth Table of S-R, J-K, and D flip flops using respective ICs and observe timing diagrams.
7. Design a 4-bit ring counter using D Flip-Flops or JK Flip-Flops and verify the output sequence.
8. Verify the operation of a 4-bit Universal Shift Register for different modes of operation (SISO, SIPO, PISO, PIPO).
9. Draw the circuit diagram of a MOD-8 ripple counter, construct the circuit using T Flip-Flops, test with a low-frequency clock, and sketch the output waveforms.
10. Design a MOD-8 synchronous counter using T Flip-Flops, verify the result, and sketch the output waveforms.
11. Draw the circuit diagram of a single-bit comparator, construct the circuit, and test the output for all input combinations.
12. Construct a 7-Segment Display circuit using a BCD-to-7-segment Decoder and 7-Segment LED, and test it for all BCD inputs.
13. Design and realise a BCD to Excess-3 code converter and vice versa using combinational logic.
14. Design a simple decision-making digital system using Verilog HDL. Simulate and verify using ModelSim or Vivado.

Note: Implement / execute any 12 experiments.

Part B – AI / LLM and Python / MATLAB Tasks

Experiment 1 – Basic & Universal Gates

- Use AI/LLM tools to generate the truth tables for all basic and universal gates, verify logical equivalence (e.g., NAND as universal gate), and explain De Morgan's theorems.
- Use AI tools or Python (SymPy) to simplify Boolean expressions and verify logical equivalence between gate combinations programmatically.

Experiment 2 – K-Map Minimisation

- Use AI/LLM tools to assist in K-map grouping, derive the minimal SOP/POS expressions, and verify the simplification step by step.
- Use Python (SymPy or custom logic) to automate SOP/POS minimisation and validate the reduced expression against the original truth table.

Experiment 3 – 3-to-8 Decoder / Demultiplexer

- Use AI/LLM tools to explain the working of a 3-to-8 decoder, describe its enable logic, and generate the complete functional table automatically.

- Use Python to automate truth table generation for any N-to-2^1 decoder and verify against hardware observations.

Experiment 4 – 8-to-1 Multiplexer

- Use AI/LLM tools to explain how a multiplexer implements logic functions, derive the input mapping for the given four-variable function, and verify the MUX configuration.
- Build a Python-based AI-assisted tool to automatically map any given logic function to MUX inputs using truth table analysis.

Experiment 5 – Full Adder

- Use AI/LLM tools to derive the Boolean equations for sum and carry of a full adder, explain the role of the half adder stages, and verify with truth table walkthrough.
- Simulate the full adder in Python/MATLAB and verify output against the expected truth table; use a classifier to validate correct gate combinations.

Experiment 6 – SR, JK & D Flip Flops

- Use AI/LLM tools to explain the operation of S-R, J-K, and D flip flops, interpret timing diagrams, and reason about the forbidden state in S-R and race-around condition in J-K flip flops.
- Train a simple binary classifier to predict the next state of a flip flop from its current state and input, based on truth table data.

Experiment 7 – 4-Bit Ring Counter

- Use AI/LLM tools to explain the ring counter state sequence, distinguish it from a Johnson counter, and reason about self-correction and lockout states.
- Use Python to model the ring counter state machine and implement a simple pattern classifier to predict the next state in the sequence.

Experiment 8 – 4-Bit Universal Shift Register

- Use AI/LLM tools to explain all four modes of a universal shift register (SISO, SIPO, PISO, PIPO), compare their timing diagrams, and describe practical applications.
- Use Python to simulate shift register waveforms for each mode and compare automated output against hardware-observed waveforms.

Experiment 9 – MOD-8 Ripple Counter

- Use AI/LLM tools to explain the modulus concept, the difference between synchronous and asynchronous (ripple) counters, and identify propagation delay issues in ripple counters.
- Use Python to automate waveform generation for MOD-8 ripple counter states and compare simulated vs. observed waveforms programmatically.

Experiment 10 – MOD-8 Synchronous Counter

- Use AI/LLM tools to explain the design procedure for a synchronous counter – state diagram, state table, flip flop excitation equations – and compare with the ripple counter approach.
- Use AI-assisted state table generation to automatically derive T flip-flop excitation equations and validate the counter sequence.

Experiment 11 – Single-Bit Comparator

- Use AI/LLM tools to derive the logic expressions for a 1-bit comparator (A>B, A=B, A<B), verify with truth table walkthrough, and generalise to N-bit comparator design.

- Use Python to automate truth table generation and output verification for comparator circuits of arbitrary bit width.

Experiment 12 – BCD-to-7-Segment Display

- Use AI/LLM tools to explain BCD-to-7-segment decoder logic, derive the segment activation truth table, and generate the segment mapping for all 10 BCD digits.
- Build a Python-based AI tool that maps any BCD digit to the correct 7-segment display pattern using truth table lookup or logic minimisation.

Experiment 13 – BCD to Excess-3 Code Converter

- Use AI/LLM tools to derive the logic equations for BCD-to-Excess-3 and Excess-3-to-BCD conversion, minimise them using K-maps, and verify the conversion for all valid inputs.
- Use Python (SymPy) to automate logic simplification for both conversion directions and verify the circuit output against the expected code mapping.

Experiment 14 – Verilog HDL Decision-Making System

- Use AI/LLM tools to assist in Verilog code generation for the decision-making system, debug syntax and logical errors, and explain the RTL structure.
- Simulate the Verilog design using ModelSim or Vivado; optionally train a simple decision tree classifier to replicate the logic of the designed system.

Note: Any six experiments need to be implemented using appropriate AI/LLM tools and/or Python/MATLAB-based simulations.

AI Integration: AI/ML integration is embedded across all 14 experiments in two tiers: (i) AI/LLM tools (ChatGPT, Claude.ai, Gemini) are used for truth table generation, K-map grouping, Boolean minimisation verification, timing diagram interpretation, Verilog code generation, and RTL debugging – bridging theory with hardware observation; (ii) Python/SymPy and Scikit-learn tools are applied for automated SOP/POS minimisation, MUX input mapping, flip flop next-state classification, counter waveform simulation, comparator truth table automation, 7-segment pattern lookup, and decision tree replication of Verilog logic. Any six of the fourteen AI/ML task pairs must be completed, at the subject expert's discretion

Recommended Tools & Platforms

- ModelSim / Vivado (Xilinx) – Verilog HDL simulation, RTL waveform verification, and synthesis for Experiment 14
- Digital Trainer Kit – hardware verification of all combinational and sequential experiments (Experiments 1–13)
- Python (SymPy, NumPy, Scikit-learn) on Google Colab (free) – Boolean minimisation, truth table automation, flip flop classifiers, counter waveform simulation
- ChatGPT / Claude.ai / Gemini – LLM-based truth table generation, K-map assistance, Verilog code generation, and RTL debugging
- LibreOffice Calc (free, open-source) – truth table and waveform data recording templates for all experiments

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26SE05202S	SE	Data Structures using Python	1	0	0	2	2

Pre Requisites: Basics of Phyton

Course Objectives:

- To introduce fundamental data structures — linked lists, stacks, queues, trees, and graphs — and implement them using Python with practical coding exercises covering insertion, deletion, traversal, and search operations.
- To develop understanding of advanced tree-based structures including AVL Trees, Heaps, Tries, Segment Trees, and Fenwick Trees, with emphasis on self-balancing, priority management, prefix search, and range query efficiency.
- To familiarise students with graph algorithms — Dijkstra's, Bellman-Ford, Kruskal's, Prim's, and Topological Sort — and apply them to solve network optimisation and dependency resolution problems.
- To equip students with hashing techniques including collision resolution strategies (chaining, linear probing, quadratic probing, double hashing) and understand Python's built-in dict internals through hands-on experiments.
- To enable students to analyse time and space complexity of data structure operations, automate experimental data processing using Python, and develop AI-assisted applications integrating multiple data structures.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Design and implement fundamental data structures — linked lists, stacks, queues, binary trees, BST, and graphs — in Python; trace insertion, deletion, traversal, and search operations; analyse and compare their time and space complexities using Big-O notation. (L3)

CO2: Apply advanced tree-based data structures — AVL Trees, Heaps, Tries, Segment Trees, and Fenwick Trees — to solve computational problems involving self-balancing, priority scheduling, prefix search, and efficient range queries; verify correctness against brute-force results. (L3)

CO3: Use graph algorithms (Dijkstra's, Bellman-Ford, Kruskal's, Prim's, Topological Sort) to solve network optimisation, shortest path, and dependency resolution problems; compare algorithm performance on sparse and dense graphs. (L4)

CO4: Implement hashing techniques with collision resolution strategies (separate chaining, linear probing, quadratic probing, double hashing); compare collision counts and lookup performance; apply sliding window and sparse table methods for range-based problems. (L4)

CO5: Automate complexity analysis and visualise empirical vs theoretical Big-O curves using Python; develop an AI-assisted application (autocomplete engine or graph route optimiser) integrating at least two data structures; evaluate model and algorithm performance using standard metrics. (L5)

CO – PO Mapping:

Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	2	2	2	3	1	3	3	3		2	1	1
CO2	3	3	3	2	3	1	3	3	3		2	1	1
CO3	3	3	2	3	3	1	3	3	3		2	2	1
CO4	3	3	2	3	3	1	3	3	3		2	1	1
CO5	2	3	3	3	3	2	3	3	3		3	2	2

Unit I: Data Structures – Fundamentals:

Topics / Concepts

- Fundamentals of Python: Lists, Tuples, Dictionaries, Sets, Comprehensions, Functions, Recursion, Lambda expressions
- Linked Lists: Singly Linked List, Doubly Linked List, Circular Linked List — Insertion, Deletion, Traversal, Reversal, Merging two sorted lists
- Stacks: Stack using list and collections.deque, Applications — balanced parentheses, infix to postfix conversion, evaluation of postfix expressions
- Queues: Simple Queue, Circular Queue, Deque (Double-ended Queue), Priority Queue using heapq module
- Trees: Binary Tree, Binary Search Tree (BST) — Insertion, Deletion, Traversals (Inorder, Preorder, Postorder)
- Graphs: Adjacency Matrix and Adjacency List representation, BFS and DFS traversals

Experiments

1. Implement a Singly Linked List with insert, delete, search, and reverse operations; display the list after each operation.

2. Implement a Doubly Linked List; perform forward and backward traversal and deletion by value.

3. Write a Python program using a Stack to check balanced parentheses, convert an infix expression to postfix, and evaluate the postfix expression.

4. Implement a Circular Queue using a list; perform enqueue, dequeue, and display with overflow and underflow handling.

5. Build a Binary Search Tree (BST) with insert, delete, and search operations; display Inorder, Preorder, and Postorder traversals and verify the BST property.

Unit II: Advanced Data Structures – Trees and Heaps:

Topics / Concepts

- AVL Trees: Self-balancing BST, Rotations — LL, RR, LR, RL, Insertion and Deletion with balancing factor
- Heaps: Min Heap and Max Heap, Heap operations using heapq, Heap Sort, Applications
- Tries: Trie construction, Insert, Search, and Delete operations, Applications in autocomplete and spell checking

- Segment Trees: Construction, Range query (sum, min, max), Point update, Lazy propagation
- Fenwick Tree: Construction, Prefix sum queries, Point updates, Applications

Experiments

1. Implement AVL Tree insertion with all four rotations (LL, RR, LR, RL); display the balance factor and height after each insertion to confirm self-balancing.

2. Implement Min Heap and Max Heap; perform insert, extract-min/max, and heapify operations and implement Heap Sort using Python's heapq module.

3. Build a Trie data structure supporting insert, search, and delete of words; implement an autocomplete feature that suggests words for a given prefix.

4. Build a Segment Tree for a given array; perform range sum and range minimum queries with point update support; verify correctness against brute-force results.

5. Implement a Fenwick Tree (Binary Indexed Tree) to support prefix sum queries and point updates; compare query results with a naive prefix-sum array approach.

Unit III: Advanced Data Structures – Graphs and Hashing:

Topics / Concepts

- Graph Algorithms: Dijkstra's Shortest Path, Bellman-Ford Algorithm, Kruskal's and Prim's Minimum Spanning Tree, Topological Sort (Kahn's and DFS-based)
- Hashing: Hash functions, Collision resolution — Chaining and Open Addressing (Linear Probing, Quadratic Probing, Double Hashing), Python dict internals
- Sliding Window and Sparse Table: Sliding window maximum using deque, Sparse table for static Range Minimum Query (RMQ)

Experiments

1. Implement Dijkstra's algorithm using a priority queue to find the shortest path from a source vertex; display distances to all nodes.

2. Implement Bellman-Ford algorithm on a weighted directed graph; find shortest paths from a source vertex and detect negative weight cycles.

3. Find the Minimum Spanning Tree of a weighted undirected graph using both Kruskal's algorithm (with Union-Find) and Prim's algorithm; compare the total MST cost.

4. Implement Topological Sort using Kahn's BFS-based algorithm on a DAG and apply it to determine a valid execution order for a set of dependent tasks.

5. Implement a Hash Table with insert, search, and delete using Separate Chaining and Open Addressing (Linear Probing); compare collision counts and performance for both methods.

AI Integration: AI integration adds three open-ended exercises following the regular experiments: (i) Complexity Visualiser (Python / Matplotlib) — instrument each data structure operation with time.perf_counter(); plot empirical time vs n curves and overlay theoretical Big-O bounds; identify crossover points between structures; (ii) Autocomplete Engine (Trie + ML ranking, Experiment Unit II–3) — build a Trie-based autocomplete system; rank suggestions using TF-IDF or a lightweight n-gram model trained on a sample corpus; evaluate precision@k; (iii) Graph Route Optimiser (NetworkX + Dijkstra's) — model a real city road network as a weighted graph; apply Dijkstra's and Bellman-Ford; visualise shortest paths using Matplotlib; compare runtime for sparse vs dense graphs — reinforcing the connection between theoretical algorithm design and real-world network optimisation.

Recommended Tools & Platforms

- Python (NumPy, Matplotlib, NetworkX, scikit-learn) on Google Colab (free) – complexity visualisation, autocomplete ML ranking, graph route optimisation
- VisuAlgo (free) – visualgo.net – interactive step-by-step animation of linked lists, BST, AVL, heaps, sorting, graphs, and hashing
- Python Tutor (free) – pythontutor.com – visualise call stacks, recursion traces, and object references for linked list and tree operations
- GeeksforGeeks IDE (free) – online Python compiler with a built-in DSA problem set for practice after each experiment
- LeetCode / HackerRank (free tier) – competitive programming problems mapped to each unit for assessment and self-evaluation

B. Tech. – II Year I Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26BSHB214A	MC	**Environmental Science** (Common to all branches of Engineering)	2	0	0	0	0

Pre Requisites: Basic knowledge of environmental science, ecology, natural resources, biodiversity, pollution, sustainable development, and elementary computer/IT concepts.

Course Objectives:

- To create awareness about environmental issues, natural resource management, and the need for sustainable development.
- To explain the structure and function of various ecosystems and the significance of biodiversity and its conservation.
- To describe causes, effects, and control of various types of pollution and principles of solid waste management.
- To examine social, ethical, and legislative issues related to environment and sustainable development in India.
- To understand human population dynamics, environmental health linkages, and the role of IT and AI tools in environmental monitoring

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Apply the multidisciplinary concepts of environmental studies to analyze the uses, over-exploitation, and environmental problems associated with forest, water, mineral, food, and energy resources. (L3)

CO2: Apply the concepts of ecosystem structure and function to different ecosystem types, and analyze the value, threats, and conservation strategies of biodiversity. (L3)

CO3: Identify causes, effects, and control measures of air, water, soil, marine, noise, thermal, and nuclear pollution; apply solid waste management principles; analyse pollution case studies and disaster management strategies.(L4)

CO4: Analyse social issues related to unsustainable development; evaluate impacts of climate change and ozone depletion; examine Indian environmental legislation and assess enforcement challenges. (L4)

CO5: Describe population growth trends and environmental impacts; demonstrate the role of IT and AI tools in environmental monitoring and field data collection. (L3)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	2	1			1	3	2				2	2	1
CO2	2	2		1	2	3	2				2	2	1
CO3	2	2	2	2	2	3	3				2	2	2
CO4	2	2	2	2	2	3	3				3	2	2
CO5	1	1		1	3	3	2				3	3	3

Unit I: Multidisciplinary Nature of Environmental Studies and Natural Resources:

Core Content: Multidisciplinary Nature of Environmental Studies: definition, scope, and importance — need for public awareness. Natural Resources: renewable and non-renewable resources — forest resources (use, over-exploitation, deforestation, case studies), water resources (use and over-utilisation, floods, drought, conflicts over water, dams), mineral resources (environmental effects of extracting and using mineral resources), food resources (world food problems, effects of modern agriculture, fertilizer-pesticide problems), energy resources (use and exploitation of conventional and non-conventional energy sources).

AI Integration: Students use Google Earth Engine for deforestation and land-use change mapping, Python (scikit-learn) for groundwater level prediction, and ML forecasting tools for renewable energy output analysis.

Free/Open-Source AI Tools: Google Earth Engine (free cloud GIS); QGIS (free, open-source); Python (scikit-learn, Matplotlib) on Google Colab (free); Global Forest Watch (free dashboard); AI tools: ChatGPT / Gemini

Unit II: Ecosystems and Biodiversity and its Conservation:

Core Content: Ecosystems: concept, structure and function — producers, consumers and decomposers — energy flow, ecological succession, food chains, food webs and ecological pyramids. Types, characteristic features, structure and function of: forest, grassland, desert, and aquatic ecosystems. Biodiversity and its Conservation: definition, bio-geographical classification of India, value of biodiversity, India as a mega-diversity nation, hot-spots, threats to biodiversity, endangered and endemic species of India, in-situ and ex-situ conservation.

AI Integration: Students use iNaturalist for AI-assisted species identification during a campus biodiversity survey, MaxEnt for biodiversity hotspot mapping, and Google Earth Engine for NDVI-based ecosystem health comparison.

Free/Open-Source AI Tools: iNaturalist (free app/web); MaxEnt (free species distribution model); Google Earth Engine (free); QGIS (free); Python on Google Colab (free)

Unit III: Environmental Pollution and Solid Waste Management:

Core Content: Environmental Pollution: definition, cause, effects and control measures of air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution, and nuclear hazards. Solid Waste Management: causes, effects and control measures of urban and industrial wastes — role of an individual in prevention of pollution — pollution case studies — disaster management: floods, earthquake, cyclone and landslides.

AI Integration: Students build an ML-based Air Quality Index prediction model using Python (scikit-learn, TensorFlow), analyse IoT water quality sensor data for anomaly detection, and use QGIS/Python for disaster risk zone mapping.

Free/Open-Source AI Tools: OpenAQ (free global AQ data API); QGIS (free); Python (scikit-learn, TensorFlow, Matplotlib) on Google Colab (free); CPCB data portal (free); AI tools: ChatGPT / Gemini

Unit IV: Social Issues and the Environment:

Core Content: From unsustainable to sustainable development. Urban problems related to energy. Water conservation, rainwater harvesting, watershed management. Resettlement and rehabilitation of people — problems and case studies. Environmental ethics: issues and possible solutions. Climate change, global warming, acid rain, ozone layer depletion — case studies. Wasteland reclamation. Consumerism and waste products. Environment Protection Act, Air and Water Pollution Control Acts, Wildlife Protection Act, Forest Conservation Act — issues in enforcement. Public awareness.

AI Integration: Students analyse CMIP6 climate model data with Python (xarray, Matplotlib), estimate carbon footprints using scikit-learn, and use QGIS/Python for watershed delineation and rainwater harvesting potential mapping.

Free/Open-Source AI Tools: Python (xarray, Matplotlib, scikit-learn) on Google Colab (free); CMIP6 climate data (free, ESGF portal); QGIS (free); AI tools: ChatGPT / Gemini

Unit V: Human Population and the Environment:

Core Content: Population growth, variation among nations — population explosion — family welfare programmes. Environment and human health. Human rights. Value education. HIV/AIDS. Women and child welfare. Role of Information Technology in environment and human health. Case studies. Field Work: visit to a local area to document environmental assets (river, forest, grassland); visit to a local polluted site; study of common plants, insects, and birds.

AI Integration: Students use Python regression and LSTM models for population growth forecasting, explore AI in public health surveillance, and use iNaturalist/eBird with geo-tagging during field work to document environmental assets.

Free/Open-Source AI Tools: iNaturalist (free); eBird (free); QGIS (free); Python (scikit-learn, TensorFlow) on Google Colab (free); OpenStreetMap (free); AI tools: ChatGPT / Gemini

B. Tech. – II Year
II Semester

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26BSHB213T	BS	**Biology for Engineers** (Common to all branches of Engineering)	2	0	0	0	2

Pre Requisites: Basic Sciences (Intermediate level)

Course Objectives:

- To provide foundational biological knowledge with engineering relevance.
- To demonstrate AI-driven applications in biology and bioengineering.
- To encourage interdisciplinary teaching that connects biology, engineering, and computational tools.
- To prepare students for innovation in healthcare, materials, and bio-industries.
- To evaluate biomimetic principles and emerging bioengineering trends for real-world engineering applications.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

COl: Apply the fundamentals of biology, biomolecules, and human systems to engineering applications. (L3)

CO2: Apply AI tools and computational techniques for biological data analysis, biomolecule visualisation, and healthcare applications. (L3)

CO3: Analyse biomolecules and bio-inspired systems for solving engineering problems and developing sustainable technologies. (L4)

CO4: Design biomimetic and bioengineering solutions using interdisciplinary approaches and AI-enabled tools. (L5)

CO5: Evaluate emerging trends in bioengineering such as 3D bioprinting, regenerative medicine, and AI-based diagnostics for societal applications. (L5)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	1	2	1	1	1	2	1				2	1	1
CO2	2	3	2	2	2	2	1				2	2	2
CO3	2	3	2	3	3	2	1				3	2	1
CO4	2	3	2	3	3	2	1				3	2	2
CO5	2	3	3	3	3	2	1				3	2	2

Unit I: Foundations of Biology and AI:

Core Content: Cell as the basic unit of life. Carbohydrates, proteins, lipids, enzymes, vitamins, hormones — structure, function, and engineering relevance.

AI Integration:AI-based visualization of biomolecules, Case studies on AI in drug discovery.

Free/Open-Source AI Tools: AlphaFold (free via EBI); DeepChem (free, open-source); Python (NumPy, Matplotlib) on Google Colab (free); AI tools: ChatGPT / Gemini

Unit II: Biomolecules in Engineering Applications:

Core Content: Carbohydrates in bioplastics (PHA, PLA). Proteins in food engineering (whey protein, plant analogs). Lipids in biodiesel and detergents. AI-driven generative design for biomaterials.

AI Integration: AI-driven generative design for biomaterials, Lipids in biodiesel & detergents.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab (free); ANSYS student version (free); AI tools: ChatGPT / Gemini

UNIT III: Human Systems and Bio-Designs

Core Content: Brain as CPU (EEG, robotic prosthetics). Eye as camera (optical corrections, lens materials). Heart as pump (ECG, stents). Kidney as filtration (dialysis systems).

AI Integration: AI-based ECG anomaly detection, Robotic arm design inspired by neural signals, Use of AI imaging tools to detect cataracts, Simulate stent design using ANSYS.

Free/Open-Source AI Tools: Python (TensorFlow, scikit-learn, Matplotlib) on Google Colab (free); ANSYS student version (free); AI tools: ChatGPT / Gemini

UNIT IV: Bio-Inspired Materials and Mechanisms

Core Content: Photosynthesis → photovoltaic cells. Bird flight → GPS and aircraft navigation. Lotus leaf → superhydrophobic surfaces. Kingfisher beak → bullet train design.

AI Integration: Model solar energy conversion inspired by photosynthesis, AI simulation of lotus-leaf hydrophobicity, Kingfisher-inspired aerodynamic modelling, Use of AI to design self-cleaning surfaces.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab (free); ANSYS student version (free); AI tools: ChatGPT / Gemini

UNIT V: Emerging Trends in Bioengineering:

Core Content: Muscular and skeletal scaffolds. 3D bioprinting of tissues (ear, bone, skin). AI in medical imaging (MRI, CT scans). AI in diagnostics and predictive healthcare.

AI Integration: AI in medical imaging (MRI, CT scans), AI in diagnostics and predictive healthcare.

Free/Open-Source AI Tools: Python (TensorFlow, OpenCV, Matplotlib) on Google Colab (free); ANSYS student version (free); AlphaFold (free via EBI); AI tools: ChatGPT / Gemini

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26HMHS204T	**HM**	**Universal Human Values – Understanding Harmony & Ethical Human Conduct** (Common to all branches of Engineering)	**3**	**0**	**0**	**0**	**3**

Pre Requisites: Basic understanding of ethics, human values, society and environmental responsibility, along with openness to self-reflection and value-based learning.

Course Objectives:

- To introduce students to the philosophy, principles, and stages of value education and its relevance to engineering practice.
- To enable students to explore harmony at individual, family, societal, and ecological levels through structured self-reflection.
- To develop an understanding of professional ethics, engineering codes of conduct, and the consequences of unethical practice.
- To expose students to the concept of ecological balance, sustainable development, and the engineer's responsibility to nature.
- To cultivate ethical reasoning through analysis of real engineering case studies, AI ethics debates, and personal value charters.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: To apply the concepts of universal human values, natural acceptance, and the purpose of human life as articulated in Indian value philosophy to personal and professional decision-making.(L3)

CO2: Apply the framework of values-based living to personal relationships, family harmony, and societal well-being in daily life contexts. (L3)

CO3: Analyse ethical dilemmas in engineering practice using the lens of universal human values and differentiate value-driven from interest-driven conduct. (L4)

CO4: Evaluate current engineering and social practices for their alignment with sustainability, ecological balance, and universal human order. (L5)

CO5: Create a personal value charter and an action plan for ethical engineering practice using AI reflection tools and collaborative dialogue. (L6)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1–Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1						**2**	**3**	**1**	**2**		**2**		
CO2						**3**	**3**	**2**	**2**		**2**		
CO3						**3**	**3**	**2**	**2**		**3**		
CO4						**3**	**3**	**2**	**2**		**3**		
CO5						**3**	**3**	**3**	**3**		**3**		

Unit I: Introduction to Value Education and Human Consciousness:

Core Content: Need for value education: crisis of values in modern society. Human being: a co-existence of Self (Jeevan) and Body; consciousness as a distinguishing feature. Natural acceptance: the innate human capacity to know what is right. Activities of the Self: Knowing, Assuming, Recognising, Fulfilling. Difference between animal consciousness and human consciousness.

AI Integration: Present ethical dilemmas to AI and compare AI responses with naturally accepted human values, use an AI journalling assistant to document daily natural acceptances and violations, can AI ever have human values? Debate using structured arguments

Free/Open-Source AI Tools: ChatGPT / Gemini (free tiers); Notion AI (free tier) for journalling

Unit II: Harmony in the Individual:

Core Content: Harmony between Self and Body: needs of the Self (happiness, trust) vs. needs of the Body (food, shelter, clothing). Four dimensions of human being: Icchha (desire), Vichar (thought), Anubhav (experience), Bodh (realisation). Feelings in relationships: nine feelings — trust, respect, affection, care, guidance, reverence, glory, gratitude, love. Understanding happiness and prosperity: holistic definition beyond materialistic view. Self-regulation vs. external regulation: inner motivation and its role in ethical conduct.

AI Integration: Explore conversations about emotional needs; critically reflect on AI limitations in understanding values, create a 'Well-being Wheel'; use AI to identify gaps between material and value-based happiness, write a weekly reflection on one feeling (e.g., trust) experienced and observed.

Free/Open-Source AI Tools: Replika (free); Canva (free); Notion AI (free tier); ChatGPT / Gemini (free tiers)

Unit III: Harmony in the Family and Society:

Core Content: Family as the basic unit of living: roles and responsibilities in family. Trust as the foundational value in relationships. From family to society: comprehensive human goal — undivided society. Universal Human Order: five dimensions of human existence (Individual, Family, Society, Nature, Existence). Social justice: ensuring rights, duties, and dignified participation for all.

AI Integration: Generate scenarios of family conflicts and analyse through the lens of trust and respect, use AI to map historical social movements (Gandhi, Ambedkar) onto the five-order framework, document 3 community service observations and analyse them using the harmony framework; use AI for structuring the report.

Free/Open-Source AI Tools: ChatGPT / Gemini (free tiers); Notion AI (free tier) for report structuring

Unit IV: Harmony in Nature and Existence:

Core Content: Four orders of nature: material, plant/bio, animal, human. Interconnectedness: mutual fulfilment among the four orders. Ecological balance: current ecological crises and

human responsibility. Sustainable Development Goals (SDGs) and value-based engineering. Right understanding of existence: co-existence of units in space.

AI Integration: Analyse deforestation data and correlate with lack of ecological values, generate a sustainable engineering project idea and critique it using ecological harmony principles, create an ecological audit of the campus using satellite images (Google Earth) and document AI-assisted analysis

Free/Open-Source AI Tools: Global Forest Watch (free); Google Earth (free); ChatGPT / Gemini (free tiers)

Unit V: Ethical Human Conduct and Professional Ethics:

Core Content: Right understanding, right feeling, right action: the value-ethics-skill triad. Professional ethics: codes of conduct for engineers (ASME, IEEE, IEI). Corruption, dishonesty, and short-term thinking: causes and value-based remedies. Vision for a value-based society and universally prosperous world. AI Ethics: bias, fairness, transparency, and accountability in AI systems.

AI Integration: Demonstrate AI bias using sample datasets, analyse Bhopal Gas Tragedy / Challenger Disaster through professional ethics lens, use a given AI system and evaluate it on fairness and transparency, write a 'Personal Value Charter' as a future engineer; use ChatGPT for drafting and self-editing for authenticity.

Free/Open-Source AI Tools: IBM AI Fairness 360 (free, open-source); ChatGPT / Gemini (free tiers); Notion AI (free tier) for charter drafting

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04204T	PC	Electronic Circuits Analysis	2	0	2	0	3

Pre Requisites: Electronic Devices and Circuits & Network Analysis

Course Objectives:

- To analyse multistage amplifiers, differential amplifiers, and understanding coupling methods.
- To understand frequency response of amplifiers and evaluate gain-bandwidth product.
- To analyse feedback amplifier topologies and design oscillators satisfying the Barkhausen criterion.
- To analyse power amplifiers in terms of efficiency, distortion, crossover characteristics, and thermal design of BJTs and MOS transistors.
- To design tuned amplifiers and multivibrators using transistors

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Analyse multistage BJT and MOS amplifiers, compute overall gain, and evaluate differential amplifier CMRR and non-ideal characteristics. (L4)

CO2: Determine the low-frequency and high-frequency response of CE and CS amplifiers and compute gain-bandwidth product (f_β, f_T). (L4)

CO3: Apply negative feedback analysis to the four feedback topologies and design RC and LC oscillators satisfying the Barkhausen criterion. (L3)

CO4: Evaluate efficiency, linearity, and thermal design considerations for Class A, B, AB, and C power amplifier configurations. (L5)

CO5: Design single and double tuned amplifiers for specified Q-factor and bandwidth, and design astable, monostable, bistablemultivibrators and Schmitt trigger circuits. (L6)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	2	1	1				2	3	3
CO2	3	3	2	2	2	1	1				2	3	3
CO3	3	3	3	2	2	1	1				1	3	3
CO4	3	3	2	2	2	1	1				2	3	2
CO5	3	3	3	2	3	1	1				2	3	3

Unit I: Multistage & Differential Amplifiers:

Core Content: Introduction, classification of amplifiers, distortion in amplifiers, coupling schemes, cascaded RC-coupled BJT amplifiers, cascode amplifier, Darlington pair, current mirror, MOS differential pair, small-signal operation of the MOS differential pair, the BJT differential pair.

AI Integration: Students use AI/LLM tools to understand RC coupling, cascode, and Darlington configurations, and to walk through CMRR calculation for a BJT differential amplifier. A 2-stage RC-coupled CE amplifier's gain is computed in Python (Google Colab) to confirm the multiplicative cascade relationship.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; Falstad Circuit Simulator; ChatGPT / Gemini

Unit II: Frequency Response of Amplifiers:

Core Content: Low-frequency response of the CS and CE amplifiers, internal capacitive effects and the high-frequency model of the MOSFET and the BJT, high-frequency response of the CE, CS, CD amplifiers, fβ, fT and gain-bandwidth product.

AI Integration: Students use AI/LLM tools to understand fβ, fT, and Miller's theorem for estimating high-frequency cutoff. The Bode magnitude response of a CE amplifier is plotted in Python (Google Colab) to measure mid-band gain, cutoff frequency, and bandwidth.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib, control) on Google Colab; ChatGPT / Gemini

Unit III: Feedback Amplifiers & Oscillators:

Core Content: Feedback Amplifiers: Introduction, the general feedback structure, properties of negative feedback, the four basic feedback topologies — series-shunt, series-series, shunt-shunt, shunt-series. Oscillators: General considerations, phase shift oscillator, Wien-bridge oscillator, LC oscillators, crystal oscillators, illustrative problems.

AI Integration: Students use AI/LLM tools to identify feedback topologies, compute closed-loop gain, and verify the Barkhausen criterion for a phase-shift oscillator. Wien-bridge oscillator frequency is computed in Python (Google Colab) for varying R and C values to confirm $f = 1/(2\pi RC)$.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib, control) on Google Colab; Falstad Circuit Simulator; ChatGPT / Gemini

Unit IV: Power Amplifiers:

Core Content: Introduction, Class A amplifiers (series fed, transformer coupled, push-pull), harmonic distortion, Class B amplifiers (push-pull, complementary symmetry), crossover distortion and Class AB operation, Class C amplifiers, power BJTs, MOS power transistors.

AI Integration: Students use AI/LLM tools to compare Class A, B, AB, and C amplifiers on efficiency, distortion, and applications. Class A and Class B output waveforms are plotted in Python (Google Colab) to compute efficiency and observe crossover distortion.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Electronics lectures

Unit V: Tuned Amplifiers &Multivibrators:

Core Content: Tuned Amplifiers: Introduction, single tuned amplifiers — Q-factor, frequency response; double tuned amplifiers — Q-factor, frequency response; concept of stagger tuning. Multivibrators: Bistable, monostable, and astablemultivibrators and Schmitt trigger operation using transistors.

AI Integration: Students use AI/LLM tools to understand the BW = f0/Q relationship and design a monostable multivibrator for a given pulse width. Single/double-tuned frequency responses and an astablemultivibrator waveform are simulated in Python (Google Colab) to verify bandwidth, Q-factor, and timing relationships.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; Falstad Circuit Simulator; ChatGPT / Gemini

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04205T	PC	Analog and Digital Communications	2	0	2	0	3

Pre Requisites: Signals, Systems and Stochastic Processes & Network Analysis

Course Objectives:

- To understand the need for modulation and analyse Amplitude Modulation and demodulation methods.
- To understand FM and PM, analyse and study generation and detection with pre-emphasis/de-emphasis.
- To study AM/FM transmitter architectures, superheterodyne receiver characteristics and AM vs. FM receiver comparison.
- To understand Pulse modulation techniques and analyse them.
- To analyse coherent digital modulation schemes and study baseband transmission, probability of error, ISI, and eye diagrams.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Analyse AM, DSB-SC, SSB, and VSB systems in time and frequency domains, determine power and bandwidth, and evaluate envelope detection, coherent detection, and balanced modulator methods.(L4)

CO2: Apply FM/PM principles to determine spectrum using Bessel functions, calculate bandwidth using Carson's rule, and evaluate Armstrong method and PLL-based detection. (L3)

CO3: Evaluate AM/FM transmitter and super heterodyne receiver architectures, calculate IF and image frequency, and compare AM and FM receiver performance. (L5)

CO4: Analyse PAM, PWM, PPM, PCM, delta modulation, and DPCM systems — computing quantisation noise, SQNR, companding advantage, and FDM/TDM trade-offs. (L4)

CO5: Apply ASK, BPSK, BFSK, QPSK, DPSK, and M-ary techniques, evaluate BER and bandwidth efficiency, and use LLMs and Python to simulate and analyse digital communication systems. (L3)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	2	2	1				2	3	3
CO2	3	3	2	2	2	2	1				2	3	3
CO3	3	3	3	2	2	2	1				1	3	3
CO4	3	3	2	2	2	2	1				2	3	3
CO5	3	3	3	2	3	2	1				2	3	3

Unit I: Amplitude Modulation:

Core Content: Need for modulation. Amplitude Modulation — time and frequency domain description, single tone modulation, power relations in AM waves, generation using switching modulator, detection using envelope detector. DSB-SC modulation — time and frequency domain description, generation using balanced modulators, coherent detection. SSB modulation — time and frequency domain description, frequency discrimination and phase discrimination methods for generating SSB, demodulation of SSB waves. Principle of vestigial sideband modulation.

AI Integration: Use AI/LLM tools to compare AM, DSB-SC, and SSB in a table (bandwidth, power efficiency, complexity) and solve modulation index and power problems. Plot AM waveforms in Python (Google Colab) for varying modulation index to observe envelope changes and overmodulation.

Free/Open-Source AI Tools: Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Communications lectures

Unit II: Angle Modulation:

Core Content: Basic concepts of phase modulation. Frequency Modulation: single tone FM, spectrum analysis using Bessel functions, narrow band FM, wide band FM, constant average power, transmission bandwidth of FM — Carson's rule. Generation of FM signal — Armstrong method. Detection of FM signal: phase locked loop. Comparison of FM and AM. Concept of pre-emphasis and de-emphasis.

AI Integration: Use AI/LLM tools to verify Carson's rule ($BW = 2(\Delta f + fm)$), compare narrow-band and wide-band FM, and explain pre-emphasis/de-emphasis and PLL-based FM detection. Plot FM spectrum in Python (Google Colab) to observe Bessel function sidebands.

Free/Open-Source AI Tools : Python (NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini

Unit III: Transmitters and Receivers:

Core Content: Classification of transmitters, AM transmitters, FM transmitters. Radio Receiver — receiver types, superheterodyne receiver, RF section and characteristics, frequency changing and tracking, intermediate frequency, image frequency, AGC, amplitude limiting, FM receiver, comparison of AM and FM receivers.

AI Integration: Use AI/LLM tools to explain the superheterodyne receiver, solve IF and image frequency examples ($fIF = fLO - fRF$; $fimage = fRF + 2 \cdot fIF$), and compare AM and FM receivers in a table. Simulate the mixing stage in Python (Google Colab) to visualise IF extraction.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Communications lectures

Unit IV: Pulse Modulation:

Core Content: Types of pulse modulation — PAM, PWM and PPM. Comparison of FDM and TDM. Pulse Code Modulation: PCM generation and reconstruction, quantisation noise, non-uniform quantisation and companding, delta modulation, DPCM.

AI Integration: Use AI/LLM tools to explain PAM, PWM, PPM, and PCM, solve a quantisation example (step size, SQNR), and compare FDM vs. TDM and μ-law/A-law companding. Plot original vs. quantised signals in Python (Google Colab) at 3-bit, 4-bit, and 8-bit to observe error reduction.
Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini

Unit V: Digital Modulation Techniques:
Core Content: Coherent digital modulation schemes — ASK, BPSK, BFSK, QPSK, DPSK. M-ary modulation techniques, power spectra, bandwidth efficiency. Baseband transmission and optimal reception of digital signals: baseband signal receiver, probability of error, optimum receiver, coherent reception, ISI, eye diagrams.
AI Integration: Use AI/LLM tools to compare ASK, BPSK, BFSK, and QPSK in a table (bits/symbol, bandwidth, noise immunity) and explain ISI, eye diagram interpretation, and matched-filter receiver. Plot BPSK and QPSK signals in Python (Google Colab) to verify 90° phase spacing in QPSK constellation.
Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Digital Communications lectures.

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04206T	PC	EM Waves and Transmission Lines	2	0	2	0	3

Pre Requisites: Physics for Communication Systems, Network Analysis & Engineering Mathematics (Vector Calculus)

Course Objectives:

- To understand electrostatic field concepts and compute electric fields and capacitance for standard charge configurations.
- To apply Biot-Savart's law, Ampere's circuital law, and Faraday's law of induction to analyse magnetostatic fields and understand Maxwell's equations for time-varying fields.
- To derive and apply the electromagnetic wave equation, understand plane wave propagation in different media, and analyse reflection and refraction phenomena.
- To analyse transmission line parameters, derive the transmission line equations, and compute characteristic impedance and propagation constant for lossless and distortionless lines.
- To apply transmission line theory for input impedance, reflection coefficient, VSWR computation, and use the Smith chart for impedance matching and stub design.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply Coulomb's law, Gauss's law, and Poisson's/Laplace's equations to compute electric field intensity, potential, and capacitance for various charge distributions. (L3)

CO2: Apply Biot-Savart's law, Ampere's law, and Maxwell's equations to analyse magnetostatic fields, time-varying fields, and electromagnetic boundary conditions. (L3)

CO3: Analyse uniform plane wave propagation in different media, compute attenuation and phase constants, skin depth, and evaluate reflection/refraction phenomena. (L4)

CO4: Compute transmission line parameters, characteristic impedance, and propagation constant; analyse lossless and distortionless line conditions. (L3)

CO5: Determine input impedance, reflection coefficient, and VSWR for terminated transmission lines; apply the Smith chart for single-stub impedance matching design. (L4)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	1		1				1	3	2
CO2	3	3	2	2	2		1				2	3	2
CO3	3	3	2	2	2		1				2	3	3
CO4	3	3	2	2	2		1				1	3	3
CO5	3	3	3	2	3		1				2	3	3

Unit I: Fundamentals of Electrostatics:

Core Content: Coulomb's law, electric field intensity, electric fields due to continuous charge distributions, electric flux density, Gauss's law and applications, electric potential, Maxwell's two

equations for electrostatic fields, energy density, convection and conduction currents, continuity equation and relaxation time, dielectric constant, Poisson's and Laplace's equations, capacitance — parallel plate, illustrative problems.

AI Integration: Use AI/LLM tools to derive electric field and potential for point/line charges and verify field continuity at boundaries using Gauss's law. Plot field lines and equipotential contours in Python (Colab) by varying charge values to confirm the inverse-square law. Compute and compare capacitance for parallel-plate and coaxial geometries using Poisson's/Laplace's equations.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab (free); PhET Electric Field simulation (free); AI tools: ChatGPT / Gemini; NPTEL EM Theory lectures

Unit II: Magnetostatics & Maxwell's Equations:

Core Content: Biot-Savart law, Ampere's circuital law and applications, magnetic flux density, Maxwell's two equations for magnetostatic fields, magnetic scalar and vector potentials, forces due to magnetic fields, Ampere's force law, inductances and magnetic energy. Maxwell's Equations (Time Varying Fields): Faraday's law and transformer EMF, inconsistency of Ampere's law and displacement current density, Maxwell's equations in different final forms and word statements, conditions at a boundary surface.

AI Integration: Use AI/LLM tools to explain displacement current and its role in correcting Ampere's law; state all four Maxwell's equations in integral form with physical interpretation. Plot magnetic field vs. distance for a long current-carrying conductor in Python (Colab) to confirm the 1/r dependence from Ampere's law.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab (free); PhET Faraday's Law simulation (free); AI tools: ChatGPT / Gemini

Unit III: EM Wave Characteristics & Reflection/Refraction:

Core Content: Wave equations for conducting and perfect dielectric media, uniform plane waves — definition, relations between E and H, sinusoidal variations, wave propagation in lossy dielectrics, lossless dielectrics, free space, and good conductors, skin depth, polarisation and types. Reflection and Refraction of Plane Waves: Normal and oblique incidences for both perfect conductors and perfect dielectrics, Brewster angle, critical angle and total internal reflection, surface impedance, Poynting vector and Poynting theorem.

AI Integration: Use AI/LLM tools to compute skin depth for copper at 1 GHz using $\delta = 1/\sqrt{(\pi f \mu \sigma)}$ and compare wave behaviour in free space, lossless dielectric, and good conductor. Plot plane wave amplitude vs. penetration depth in Python (Colab) varying conductivity; derive reflection/transmission coefficients and Brewster angle for a glass-air interface numerically.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab (free); OpenEMS (free EM simulation); AI tools: ChatGPT / Gemini

Unit IV: Transmission Lines – I:

Core Content: Types, parameters, T and π equivalent circuits, transmission line equations, primary and secondary constants, expressions for characteristic impedance, propagation constant, phase and group velocities, infinite line, lossless lines, distortionless lines, illustrative problems.

AI Integration: Use AI/LLM tools to derive $Z_0 = \sqrt{[(R+j\omega L)/(G+j\omega C)]}$ and simplify for lossless conditions; explain phase vs. group velocity and dispersion on a lossy line. Plot Z_0 and propagation constant vs. frequency in Python (Colab) to observe constant Z_0 and near-zero attenuation under lossless conditions.

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab (free); AI tools: ChatGPT / Gemini; NPTEL Transmission Lines lectures

Unit V: Transmission Lines – II:

Core Content: Input impedance relations, reflection coefficient, VSWR, average power, shorted lines, open-circuited lines, and matched lines; low-loss radio frequency and UHF transmission lines. Smith chart — construction and applications, quarter-wave transformer, single stub matching, illustrative problems.

AI Integration: Use AI/LLM tools to compute input impedance, reflection coefficient, and VSWR for a $\lambda/4$ shorted stub using $Z_{in} = jZ_0 \tan(\beta l)$; explain Smith chart construction for single-stub matching. Plot $|\Gamma|$ and VSWR vs. normalised load impedance in Python (Colab) to identify the matched condition ($\Gamma = 0$, VSWR = 1).

Free/Open-Source AI Tools: Python (NumPy, Matplotlib) on Google Colab (free); Smith chart calculators online (free); AI tools: ChatGPT / Gemini

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC02209T	PC	Linear Control Systems	2	0	2	0	3

Pre Requisites: Network Analysis, Signals and Systems, Engineering Mathematics

Course Objectives:

- To understand the concepts of open-loop and closed-loop control systems, feedback, and derive mathematical models of mechanical and electrical systems.
- To analyse the time response of first-order and second-order control systems and design controllers to meet specified time-domain performance specifications.
- To apply the Routh-Hurwitz stability criterion and root locus technique to assess and predict closed-loop stability of linear control systems.
- To perform frequency-domain analysis of control systems to design compensators.
- To represent and analyse control systems in state space form and evaluate controllability and observability

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Derive mathematical models, transfer functions, and block diagram representations of translational, rotational, and electrical control systems. (L3)

CO2: Analyse transient and steady-state responses of first and second-order control systems and design PID controllers to meet time-domain specifications. (L4)

CO3: Apply Routh-Hurwitz criterion and construct root locus plots to determine stability and the effect of gain and pole-zero additions. (L3)

CO4: Construct Bode plots and Nyquist plots, determine gain and phase margins, and design Lag, Lead, and Lag-Lead frequency domain compensators. (L4)

CO5: Develop state space models, compute state transition matrices, and evaluate controllability and observability of continuous-time linear systems. (L4)

CO – PO Mapping :

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	3	3	2	2	1		1				1	3	2
CO2	3	3	2	2	2		1				2	3	3
CO3	3	3	2	2	2		1				2	3	3
CO4	3	3	2	2	2		1				1	3	3
CO5	3	3	3	2	3		1				2	3	3

Unit I: Control Systems Concepts & Mathematical Modelling:

Core Content: Open-loop and closed-loop control systems, examples, classification, feedback characteristics, effects of positive and negative feedback. Mathematical models — differential equations of translational, rotational mechanical and electrical systems, analogous systems, block diagram reduction, signal flow graphs, Mason's gain formula. DC servomotor and AC servomotor transfer functions, synchros.

AI Integration: Use AI/LLM tools to apply Mason's gain formula to a signal flow graph and reduce a two-loop block diagram; verify manually. Plot the step response of a mass-spring-damper system in Python (Google Colab) to read ωn and damping ratio.
Free/Open-Source AI Tools: Python (control, NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Control Systems lectures.

Unit II: Time Response Analysis:
Core Content: Step response, impulse response, time response of first-order systems, characteristic equation, transient response of second-order systems, time domain specifications, steady-state response, steady-state errors and error constants, P, PI, PD and PID controllers on second-order systems.
AI Integration: Use AI/LLM tools to compute rise time, peak overshoot, and steady-state error using standard second-order formulas (ζ, ωn); verify manually. Plot under-damped, critically damped, and over-damped step responses in Python (Google Colab) and compare PD-controlled vs. uncontrolled responses.
Free/Open-Source AI Tools: Python (control, NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini

Unit III: Stability Analysis in Time Domain:
Core Content: Concept of stability, Routh's stability criterion, stability and conditional stability, limitations of Routh's stability. Root locus concept, construction of root loci, effects of adding poles and zeros to G(s)H(s).
AI Integration: Use AI/LLM tools to apply Routh-Hurwitz criterion to a 3rd-order polynomial, handle the row-of-zeros case, and verify the stability range of K for a second-order system. Plot the root locus in Python (Google Colab) to observe pole movement as gain K varies.
Free/Open-Source AI Tools: Python (control, NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini

Unit IV: Frequency Response Analysis:
Core Content: Frequency domain specifications, Bode diagrams, transfer function from Bode diagram, stability analysis from Bode plots. Polar plots, Nyquist plots, phase margin and gain margin. Lag, lead, lag-lead compensator design in frequency domain.
AI Integration: Use AI/LLM tools to read gain margin and phase margin from a Bode plot, apply the Nyquist criterion, and describe Lead compensator design steps with a numerical example. Plot Bode and Nyquist diagrams in Python (Google Colab) and compare gain/phase margins against analytical values.
Free/Open-Source AI Tools: Python (control, NumPy, Matplotlib) on Google Colab; ChatGPT / Gemini; NPTEL Control Systems lectures.

Unit V: State Space Analysis of Continuous Systems:
Core Content: Concepts of state, state variables and state model, differential equations and transfer function models, block diagrams. Diagonalization, transfer function from state model,

solving time-invariant state equations, state transition matrix and its properties. System response through state space, controllability and observability.

AI Integration: Use AI/LLM tools to convert a transfer function to controllable canonical state space form, verify using $C(sI-A)^{-1}B+D$, and check controllability and observability via Kalman rank condition. Compute the state transition matrix in Python (Google Colab) and verify $\Phi(0) = I$.

Free/Open-Source AI Tools: Python (control, NumPy, SciPy, Matplotlib) on Google Colab; ChatGPT / Gemini

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC02209T	PC	Electronic Circuits Analysis Lab	0	0	0	3	1.5

Pre Requisites: Electronic Devices and Circuits & Network Analysis

Course Objectives:

- To introduce advanced amplifier configurations — Darlington pair, CE-CC multistage, cascode, differential, and feedback amplifiers — and determine their gain, bandwidth, and impedance characteristics.
- To develop understanding of RC/LC oscillators, Class A/AB power amplifiers, single-tuned amplifiers, and multivibrator circuits through hands-on design and analysis.
- To familiarise students with Schmitt trigger hysteresis, threshold voltage determination, and the impact of feedback on amplifier stability and bandwidth.
- To enable students to use AI/LLM tools to derive circuit equations, explain operation, and predict performance metrics such as gain, frequency, CMRR, efficiency, and pulse width.
- To develop ML regression and classifier models in Python/MATLAB to predict circuit performance parameters and classify waveform types from simulation or measured data.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Design and characterise advanced amplifier circuits — Darlington pair, CE-CC multistage, cascode, differential, and feedback amplifiers — measuring voltage gain, CMRR, input/output impedance, bandwidth, and frequency response using simulation and hardware.(L3)

CO2: Analyse oscillator circuits (RC phase shift, LC Colpitts/Hartley, single-tuned) and verify the oscillation frequency using the Barkhausen criterion; determine bandwidth and selectivity (Q factor) from frequency response plots. (L3)

CO3: Evaluate Class A and Class AB power amplifier performance by determining efficiency, output power, and distortion; observe and explain crossover distortion and compare Class A, B, and AB trade-offs. (L4)

CO4: Design Bistable, Astable, and Monostable multivibrators and Schmitt trigger circuits; draw and interpret output waveforms; determine oscillation frequency, pulse width, duty cycle, and upper/lower threshold voltages. (L4)

CO5: Apply ML regression models to predict circuit performance metrics (gain, CMRR, bandwidth, oscillation frequency, efficiency, threshold voltages) and develop waveform classifiers to detect distortion and identify multivibrator states from simulated or measured data. (L5)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2

CO5	3	3	3	2	3	1	3	3	3		2	3	3

List of Experiments

Part A – Advanced Amplifiers

1. Design and analyse the Darlington pair amplifier circuit. Determine the voltage gain, input impedance, and output impedance.
2. Plot and analyse the frequency response of a CE–CC (Common Emitter–Common Collector) multistage amplifier and determine bandwidth.
3. Design and analyse the Cascode amplifier circuit and determine its voltage gain, frequency response, and bandwidth.
4. Plot and analyse the frequency response of a Differential Amplifier and determine its CMRR (Common Mode Rejection Ratio).
5. Design and analyse any two topologies of feedback amplifiers (series-series, series-shunt, shunt-series, shunt-shunt) and find the frequency response of each.

Part B – Power Amplifiers and Oscillators

6. Design and analyse a Class A power amplifier. Determine efficiency, output power, and distortion.
7. Design and analyse a Class AB amplifier. Observe crossover distortion and compare performance with Class A.
8. Design and analyse an RC phase shift oscillator. Verify the oscillation frequency and observe the output waveform.
9. Design and analyse an LC oscillator (Colpitts or Hartley). Verify the oscillation frequency and observe the output waveform.
10. Plot the frequency response of a Single Tuned amplifier and determine its bandwidth and selectivity.

Part C – Multivibrators and Schmitt Trigger

11. Design a BistableMultivibrator, analyse the effect of commutating capacitors, and draw the waveforms at the base and collector of transistors.
12. Design an AstableMultivibrator and draw the waveforms at the base and collector of transistors. Determine the oscillation frequency.
13. Design a Monostable Multivibrator and draw the input and output waveforms. Determine the pulse width.
14. Draw the response of a Schmitt trigger for gain greater than one and less than one. Determine the upper and lower threshold voltages.

Note: Implement / execute any 12 experiments

AI / LLM and Python / MATLAB Tasks

Experiment 1 – Design and analyse the Darlington pair amplifier. Determine voltage gain, input impedance, and output impedance.

- Use AI/LLM to derive the Darlington pair current gain ($\beta\_D \approx \beta^2$), explain high input impedance advantage, and predict gain for different β values.
- Train a regression model to predict overall voltage gain and input impedance from individual transistor parameters (β, r_e).

Experiment 2-Plot and analyse the frequency response of a CE–CC multistage amplifier. Determine bandwidth.

- Use AI/LLM to explain the role of each stage (CE for gain, CC for impedance matching), predict the combined frequency response, and describe bandwidth shrinkage in cascaded stages.

- Apply polynomial regression to model measured frequency response and automatically determine −3 dB bandwidth and midband gain.

Experiment 3-Design and analyse the Cascode amplifier. Determine voltage gain, frequency response, and bandwidth.

- Use AI/LLM to explain the cascode configuration's advantage in reducing Miller effect, improving bandwidth, and achieving high gain; predict its frequency response.
- Train an ML regression model to estimate voltage gain and bandwidth from component values and transistor parameters.

Experiment 4- Plot and analyse the frequency response of a Differential Amplifier. Determine CMRR.

- Use AI/LLM to explain differential amplifier operation, define CMRR, and describe how the tail current source improves common-mode rejection; predict CMRR variation with circuit parameters.
- Build a regression model to predict CMRR from transistor parameters and resistor values.

Experiment 5-Design and analyse any two feedback amplifier topologies and find frequency response of each.

- Use AI/LLM to compare the four feedback topologies (series-series, series-shunt, shunt-series, shunt-shunt); explain their effect on gain, impedance, bandwidth, and stability.
- Train a classifier to identify the feedback topology from measured gain and impedance data; use regression to predict stability margins from open-loop parameters.

Experiment 6- Design and analyse a Class A power amplifier. Determine efficiency, output power, and distortion.

- Use AI/LLM to explain Class A operation, DC load line and Q-point, and derive maximum efficiency expressions (25% resistive, 50% transformer-coupled).
- Train a regression model to predict Class A efficiency and output power from Q-point location, supply voltage, and load resistance.

Experiment 7- Design and analyse a Class AB amplifier. Observe crossover distortion and compare with Class A.

- Use AI/LLM to explain crossover distortion in Class B, how Class AB bias eliminates it, and compare efficiency and linearity trade-offs between Class A, B, and AB.
- Develop an AI-based waveform classifier to detect and quantify crossover distortion from simulated or measured Class AB output signal data.

Experiment 8- Design and analyse an RC phase shift oscillator. Verify oscillation frequency and waveform.

- Use AI/LLM to derive the RC phase shift oscillator frequency formula ($f = 1/2\pi\sqrt{6}\,RC$), explain the 180° phase shift condition, and predict frequency change with component variation.
- Train a regression model to predict oscillation frequency from RC component values and verify against simulated/measured output.

Experiment 9- Design and analyse a Colpitts or Hartley LC oscillator. Verify oscillation frequency and waveform.

- Use AI/LLM to explain the LC tank circuit, Barkhausen criterion, and derive the oscillation frequency from inductor and capacitor values.
- Build a regression model to predict oscillation frequency from L and C parameter values and compare with the theoretical formula output.

Experiment 10- Plot frequency response of a Single Tuned amplifier. Determine bandwidth and selectivity.

- Use AI/LLM to explain single-tuned amplifier operation, the role of the parallel LC tank circuit, and predict bandwidth and Q factor from circuit parameters.
- Apply ML regression to estimate bandwidth and centre frequency from measured frequency response data points.

Experiment 11-Design a BistableMultivibrator. Analyse commutating capacitor effect and draw waveforms.

- Use AI/LLM to explain the two stable states of the bistablemultivibrator, the role of commutating capacitors in improving switching speed, and predict the effect of capacitor value on switching time.
- Train a waveform classifier to identify and label stable states and transition edges in bistablemultivibrator waveforms.

Experiment 12-Design an AstableMultivibrator. Draw waveforms and determine oscillation frequency.

- Use AI/LLM to derive the astable oscillation frequency ($f \approx 1/1.4RC$), explain charging/discharging cycles, and predict frequency change with component variation.
- Train a regression model to predict oscillation frequency and duty cycle from RC timing component values.

Experiment 13-Design a Monostable Multivibrator. Draw waveforms and determine pulse width.

- Use AI/LLM to explain the quasi-stable state, triggering mechanism, and derive pulse width expression ($T \approx 0.69RC$); predict pulse width for different RC values.
- Build an ML pulse width prediction model (regression) that estimates output pulse width from RC component values and supply voltage.

Experiment 14-Draw Schmitt trigger response for gain > 1 and < 1. Determine UTP and LTP.

- Use AI/LLM to explain Schmitt trigger hysteresis, derive UTP and LTP expressions, and explain behaviour for gain greater and less than unity.
- Train a regression model to predict UTP and LTP threshold voltages from resistor ratio and supply voltage parameters.

Note: Any six experiments need to be implemented using appropriate AI/LLM tools and/or Python/MATLAB-based simulations.

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26PC04205P	SE	Analog and Digital Communications Lab	0	0	0	3	1.5

Pre Requisites: Signals, Systems and Stochastic Processes & Network Analysis

Course Objectives:

- To introduce analog modulation schemes — AM, DSB-SC, FM, PAM, PWM, PPM — and FDM; include measurement of modulation index, frequency deviation, and channel bandwidth.
- To develop practical understanding of digital communication systems covering sampling theorem, TDM, Delta Modulation, PCM, and pulse modulation techniques.
- To implement digital modulation schemes — BPSK, BFSK, QPSK, DPSK — and evaluate system performance through BER vs. SNR curves, constellation diagrams, and SQNR measurements.
- To familiarise students with radio receiver characteristics including sensitivity, selectivity, and noise figure, and evaluate super heterodyne receiver architecture.
- To apply AI/LLM tools and Python/MATLAB-based simulations to derive modulation expressions, predict BER performance, detect aliasing, and classify modulation symbols using ML models.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Implement and verify analog modulation and demodulation circuits for AM, DSB-SC, FM, PAM, PWM, PPM, and FDM; measure modulation index, frequency deviation, channel bandwidth, and evaluate sensitivity and selectivity of a radio receiver. (L3)

CO2: Verify the Nyquist sampling theorem and implement TDM; implement Delta Modulation and PCM systems; observe granular noise, slope overload, and quantisation error; measure SQNR for varying bit depths. (L3)

CO3: Implement BPSK, BFSK, QPSK, and DPSK modulation and demodulation; plot BER vs. SNR curves; draw and interpret constellation diagrams; verify differential encoding and coherent/non-coherent detection. (L3)

CO4: Evaluate and compare analog and digital modulation schemes in terms of bandwidth efficiency, noise immunity, BER performance, and power requirements; assess practical limitations in circuit implementations. (L3)

CO5: Apply AI/LLM tools to derive modulation expressions and explain communication system theory; develop Python/MATLAB-based ML regression and classification models to predict BER, estimate modulation parameters, detect aliasing, and classify modulation symbols. (L3)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

CO5	2	3	3	3	3	1	3	3	3		3	3	3

List of Experiments

Section A — Analog Communication (Regular Experiments)

1. Design and implement AM modulation and demodulation circuits. Observe the modulated waveform, measure modulation index, and verify demodulation using envelope detection.
2. Design and implement DSB-SC (Double Sideband Suppressed Carrier) modulation and demodulation circuits and verify coherent detection.
3. Implement Frequency Division Multiplexing (FDM) for two or more signals and verify channel separation and bandwidth allocation.
4. Design and implement FM modulation and demodulation circuits. Measure the frequency deviation and modulation index.
5. Perform measurements on a radio receiver and evaluate sensitivity, selectivity, and noise figure.
6. Implement Pulse Amplitude Modulation (PAM) and demodulation. Observe the PAM waveform and verify signal recovery.
7. Implement Pulse Width Modulation (PWM) and demodulation. Observe the variation of pulse width with message signal amplitude.
8. Implement Pulse Position Modulation (PPM) and demodulation. Observe pulse position variation and verify signal recovery.

Section B — Digital Communication (Regular Experiments)

9. Verify the Sampling Theorem by sampling a continuous-time signal at different rates. Demonstrate aliasing when sampled below the Nyquist rate and perfect reconstruction above it.
10. Implement Time Division Multiplexing (TDM) for multiple signals and verify slot allocation and signal recovery.
11. Implement Delta Modulation and Demodulation. Observe granular noise and slope overload distortion and determine the optimal step size.
12. Implement Pulse Code Modulation (PCM) and demodulation. Observe quantisation error and measure signal-to-quantisation-noise ratio (SQNR).
13. Implement Binary Phase Shift Keying (BPSK) modulation and demodulation. Measure Bit Error Rate (BER) and plot the BER vs. SNR curve.
14. Implement Binary Frequency Shift Keying (BFSK) modulation and demodulation. Observe frequency switching and measure BER.
15. Implement Quadrature Phase Shift Keying (QPSK) modulation and demodulation. Plot the constellation diagram and measure BER.
16. Implement Differential Phase Shift Keying (DPSK) modulation and demodulation. Observe differential encoding and verify phase change detection.

Note: Design the circuits and verify the following experiments — minimum six from each section.

Part B — AI/LLM and Python / MATLAB Integration Tasks

Section A — Analog Communication: AI/LLM and Python/MATLAB Tasks

Experiment 1- AM:

- Use AI/LLM tools to explain AM modulation theory, derive the modulation index expression, explain over-modulation, and describe envelope detector operation for demodulation.
- Simulate AM modulation and demodulation in MATLAB/Python; apply regression to estimate modulation index from the measured waveform envelope data.

Experiment 2- DSB-SC:

- Use AI/LLM tools to explain the suppressed carrier concept, the need for coherent detection, and how a product detector recovers the original signal.
- Simulate DSB-SC modulation and coherent detection; use a regression or signal reconstruction model to analyse detection accuracy under different SNR conditions.

Experiment 3- FDM:

- Use AI/LLM tools to explain the FDM concept, the role of guard bands, and how channel separation is achieved in the frequency domain; predict bandwidth requirements for N channels.
- Simulate FDM with multiple channels and visualise channel separation; apply ML-based spectral analysis to verify channel isolation.

Experiment 4 -FM:

- Use AI/LLM tools to explain FM modulation principle, Carson's rule for bandwidth estimation, and the FM demodulation process using a discriminator or PLL.
- (Train a regression model to predict frequency deviation and bandwidth from modulation index and message signal frequency parameters.

Experiment 5 -Radio Receiver:

- Use AI/LLM tools to define receiver sensitivity, selectivity, and noise figure; explain the superheterodyne receiver architecture and predict performance trade-offs.
- Use Python to model and simulate key receiver parameters; apply regression analysis to predict noise figure and sensitivity from circuit component values.

Experiment 6 -PAM:

- Use AI/LLM tools to explain PAM generation, the relationship between sampling frequency and signal recovery, and the effect of sampling rate on waveform quality.
- Develop a Python-based waveform classifier to identify and categorise PAM signals from sampled waveform features and verify demodulation accuracy.

Experiment 7 -PWM:

- Use AI/LLM tools to explain PWM generation from comparator circuits, the relationship between message amplitude and pulse width, and the low-pass filter demodulation approach.
- Build an ML regression model to predict output pulse width from the instantaneous message signal amplitude and verify against simulated PWM waveform data.

Experiment 8 -PPM:

- Use AI/LLM tools to explain PPM generation, how pulse position encodes information, and compare PPM with PAM and PWM in terms of noise immunity and bandwidth.
- Train a classification model to detect and decode pulse position from PPM waveform data, mapping position values back to the original message signal.

Section B — Digital Communication: AI/LLM and Python/MATLAB Tasks

Experiment 1-Sampling Theorem:

- Use AI/LLM tools to explain the Nyquist sampling theorem, conditions for aliasing and perfect reconstruction, and the relationship between sampling frequency and signal bandwidth.
- Build a binary classifier (Logistic Regression) to detect aliasing from sampling rate and signal frequency parameters; simulate in Python/MATLAB and verify results.

Experiment 2 -TDM:

- Use AI/LLM tools to explain TDM frame structure, slot allocation, synchronisation requirements, and compare TDM with FDM in terms of efficiency and complexity.
- Simulate TDM with multiple channels and visualise time-slot allocation; apply ML-based classification to verify correct channel recovery from the multiplexed signal.

Experiment3 -Delta Modulation:

- Use AI/LLM tools to explain delta modulation operation, the causes of granular noise and slope overload, and the conditions for optimal step size selection.
- Train a regression model to predict the optimal step size minimising total distortion (granular noise + slope overload) from message signal frequency and amplitude parameters.

Experiment4 –PCM:

- Use AI/LLM tools to explain the PCM process (sampling, quantisation, encoding), derive the SQNR expression for uniform quantisation, and explain companding for non-uniform quantisation.
- Build a Python-based quantisation error analyser; use regression to predict SQNR from the number of quantisation bits and input signal amplitude.

Experiment 5 - BPSK:

- Use AI/LLM tools to explain BPSK modulation/demodulation theory, derive the BER expression in AWGN, and explain coherent detection using a matched filter or correlator receiver.
- Simulate BPSK BER vs. SNR in Python/MATLAB; train a simple ML regression model to predict BER from SNR values and compare with the theoretical BER curve.

Experiment 6 -BFSK:

- Use AI/LLM tools to explain BFSK modulation/demodulation, the orthogonality condition between the two frequencies, and compare coherent vs. non-coherent BFSK detection.
- Train a binary classifier to identify the transmitted frequency from BFSK signal features; simulate BER performance and compare with theoretical values.

Experiment 7 -QPSK:

- Use AI/LLM tools to explain the QPSK constellation diagram, the mapping of 2-bit symbols to phase values, the spectral efficiency advantage over BPSK, and coherent demodulation using a quadrature receiver.

- Simulate QPSK in Python/MATLAB and plot the constellation diagram; train a multi-class classifier (KNN or SVM) to classify received symbols from I-Q data points.

Experiment 8- DPSK:

- Use AI/LLM tools to explain differential encoding in DPSK, why DPSK does not require a coherent carrier reference, and compare its BER performance with coherent BPSK.
- Train a binary classification model to detect phase changes (+180° vs. 0°) from DPSK signal features, simulating the differential decoding operation.

Note: Any three experiments from each section to be implemented using AI/LLM tools and/or Python/MATLAB-based simulations.

Recommended Free & Open-Source AI / Computational Tools

- Python (NumPy, Matplotlib, SciPy, scikit-learn) on Google Colab (free) – signal simulation, BER analysis, ML classifiers, regression models
- MATLAB / GNU Octave (free) – analog and digital modulation simulation, constellation diagrams, BER vs. SNR plots
- scikit-learn (free, open-source) – Logistic Regression, KNN, SVM, Random Forest for BER prediction and symbol classification
- Virtual Labs – VLSI & Communication Labs, IIT / IIIT (free): https://vlabs.ac.in – simulation of AM, FM, PCM, and digital modulation experiments
- LibreOffice Calc (free, open-source) – standardised data recording templates for all experiments

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26SE04201S	SE	PCB Design and Prototype Development	1	0	0	2	2

Pre Requisites: Fundamentals of Basic Electronics

Course Objectives:

- To introduce PCB terminology, component symbols and footprints, and EDA tools for schematic creation, annotation, and netlist generation.
- To develop understanding of the PCB design flow — component placement, routing, DRC, track width selection, and artwork generation for single-side, double-side, and multilayer boards.
- To familiarise students with design-for-manufacturability (DFM) principles including layout design standards, general design factors for analog and digital circuits, and design-specification standards.
- To enable students to design open-ended PCB development boards for analog, digital, and mixed-signal applications, applying complete design-to-layout workflows.
- To develop competency in physical PCB fabrication — single-sided PCB etching, component mounting, and cabinet assembly — executing the complete cycle from schematic to finished prototype.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Use EDA tools to create schematics, annotate designs, generate netlists, map component footprints, set up PCB layers and design rules, and complete routed PCB layouts for standard analog and digital circuits.(L3)

CO2: Design manufacturable single-side and double-side PCB layouts for regulators, amplifiers, oscillators, multivibrators, and counters, applying track width selection, DRC, routing best practices, and artwork/gerbergeneration. (L3)

CO3: Apply design-for-manufacturability principles and design-specification standards (IPC- 2221, IPC-7351) to evaluate and optimise PCB layouts for analog and digital circuits, identifying and resolving design rule violations. (L4)

CO4: Independently design open-ended PCB development boards for analog, digital, and mixed-signal applications, executing the full workflow from problem definition through schematic, footprint mapping, placement, routing, and gerber generation. (L5)

CO5: Fabricate and assemble a single-sided PCB prototype — including artwork generation, chemical etching, drilling, component mounting, and soldering — and verify functional operation of the assembled circuit in a cabinet. (L6)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2

CO3	3	3	3	3	3	1	3	3	3		2	3	3
CO4	2	3	3	3	3	2	3	3	3		3	3	3
CO5	2	2	3	3	2	2	3	3	3		3	3	2

Theory Content

Unit I: Fundamentals of Basic Electronics and PCB Basics:

1. Component identification: resistors, capacitors, inductors, diodes, transistors, ICs; recognition of component symbols and their PCB footprints.
2. Understanding and reading schematics; navigating EDA schematic editors.
3. Creating a new PCB project; browsing and selecting footprint libraries.
4. Setting up PCB layers; understanding layer stack-up for single, double, and multilayer boards.
5. Design Rule Checking (DRC): purpose, setup, and interpreting DRC violations.
6. Track width selection: current-carrying capacity, IPC-2221 guidelines, and impedance-controlled routing basics.
7. Component selection criteria: package types, availability, thermal and electrical ratings.
8. Routing fundamentals: manual and auto-routing, clearance rules, via placement, and design completion.

Unit II: Introduction to PCB:

9. Definition and need/relevance of Printed Circuit Boards in modern electronics.
10. Background and history of PCB: evolution from point-to-point wiring to advanced HDI boards.
11. Types of PCB: single-sided, double-sided, multilayer, rigid, flexible, and rigid-flex.
12. Classes of PCB design: Class 1 (General Electronics), Class 2 (Dedicated Service), Class 3 (High Reliability).
13. Terminology in PCB design: trace, pad, via, annular ring, silk screen, solder mask, gerber, drill file, BOM.
14. Different Electronic Design Automation (EDA) tools: KiCad, Altium Designer, Eagle, OrCAD, Proteus — features and comparison.

Unit III: PCB Design Process:

15. PCB design flow: concept → schematic → netlist → placement → routing → DRC → gerber generation → fabrication.
16. Placement and routing strategies: component clustering, decoupling capacitor placement, power and ground plane routing.
17. Steps involved in layout design: board outline, layer assignment, component placement, trace routing, copper pour.
18. Artwork generation methods: manual tape-up (legacy) and CAD-based gerber/drill file generation.
19. General design factors for digital circuits: signal integrity, crosstalk, return current paths, decoupling, clock routing.
20. General design factors for analog circuits: noise minimization, ground plane separation, component orientation, shielding.
21. Layout and artwork for single-side, double-side, and multilayer boards.

22. Design for manufacturability (DFM): panelisation, fiducial markers, test points, solder mask expansion, minimum feature sizes.
23. Design-specification standards: IPC-2221, IPC-7351 (footprint standards), IPC-A-610 (acceptability of assemblies).

Practice Exercises (Any Twelve to be performed)

1. **PCB Design Tool Familiarisation (Mandatory)**
   - Schematic Design: familiarisation of the Schematic Editor; schematic creation, annotation, and netlist generation.
   - Layout Design: familiarisation of the Footprint Editor; mapping of components; creation of PCB layout from schematic.
   - Create new schematic components (custom symbols).
   - Create new component footprints (custom land patterns).
2. Voltage Regulator circuit using IC 7805: schematic, PCB layout with proper bypass capacitors, DRC, and gerber generation.
3. Inverting Amplifier or Summing Amplifier using Op-Amp (e.g., LM741 / TL071): schematic, PCB layout with power supply decoupling.
4. Full-Wave Rectifier with filter capacitor: schematic, PCB layout, component footprint mapping, DRC.
5. AstableMultivibrator using IC 555: schematic, PCB layout, frequency calculation, and layout verification.
6. Monostable Multivibrator using IC 555: schematic, PCB layout, pulse-width calculation, and layout verification.
7. RC Phase-Shift Oscillator or Wein-Bridge Oscillator using Transistor: schematic, PCB layout, frequency design.
8. Full-Adder using Half-Adders: logic schematic, PCB layout for the combinational circuit, DRC and routing.
9. 4-Bit Binary / MOD-N Counter using D Flip-Flops: schematic, PCB layout, clock routing, and DRC.
10. Development Board for an open-ended Analog Application: student-defined analog circuit; full design flow from schematic to routed PCB.
11. Development Board for an open-ended Digital Application: student-defined digital circuit; full design flow from schematic to routed PCB.
12. Open-Ended Experiment (Analog / Digital / Mixed-Signal): a circuit of similar nature and magnitude assigned by the teacher; student to independently design, lay out, and simulate / execute.
13. Power Section Development Board: design a PCB incorporating IC 7805, filter capacitors, current-limiting resistor, power-on LED indicator, and input/output headers; generate gerber files.
14. **PCB Fabrication and Assembly (Mandatory Capstone Exercise):** fabricate a single-sided PCB for any one of the above circuits; mount components and assemble the complete board in a cabinet. Document the full process: artwork printout, UV exposure / chemical etching, drilling, soldering, and functional testing.

Note: Students are required to perform any twelve of the following exercises using an approved EDA tool (KiCad / Eagle / Altium / Proteus). Exercises include schematic creation, PCB layout, and physical fabrication.

Recommended EDA and Fabrication Tools

- KiCad EDA (free, open-source) – schematic editor, PCB layout, 3D viewer, gerber generation; recommended primary EDA tool
- Eagle CAD (free for students) – schematic and layout editor; widely used in industry; extensive component libraries
- Proteus Design Suite (licensed / institutional) – schematic, PCB layout, and circuit simulation in one environment
- FreePCB / pcb-rnd (free, open-source) – lightweight PCB editors for simple single-layer and double-layer boards
- PCBWay / JLCPCB online Gerber viewers (free) – verify fabrication files before submission; check layer stack-up online
- LibreOffice Calc (free) – Bill of Materials (BOM) preparation and component tracking

B. Tech. – II Year II Semester

Course Code	Category	Name of the Course	L	T	Pr	P	C
26HMHS206A	MC	**Technical Paper Writing and IPR** (Common to all branches of Engineering)	2	0	0	0	0

Pre Requisites: Communicative English

Course Objectives:

- To introduce students to technical communication principles and types of technical documents used in engineering practice.
- To develop skills in writing well-structured technical reports, research proposals, and scientific papers.
- To expose students to the Intellectual Property Rights system — patents, trademarks, copyrights, and trade secrets — and the patent filing process in India.
- To enable students to conduct patent searches, analyse patent claims, and draft a basic patent disclosure.
- To integrate AI writing tools throughout the course while building critical evaluation and academic integrity skills.

Course Outcomes (COs):

On successful completion of the course, Student will be able to

CO1: Apply the principles, types, and structure of technical reports and the fundamentals of Intellectual Property Rights (IPR) in relevant contexts. (L3)

CO2: Apply the principles of technical writing to produce well-structured laboratory reports, project reports, and technical proposals. (L3)

CO3: Analyse technical documents for clarity, coherence, accuracy, and compliance with formatting standards using AI-powered review tools. (L4)

CO4: Evaluate patent documents, prior art, and IP claims to assess novelty and inventiveness of an engineering innovation. (L5)

CO5: Create a complete technical report and draft a patent disclosure for an engineering project, integrating AI tools for writing assistance. (L6)

CO – PO Mapping:

- Scale: 3 – Strong, 2 – Moderate, 1 – Slight

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PSO1	PSO2
CO1	1	1	1	1			2	1	3	2	2	1	1
CO2	2	2	2	2			2	2	3	2	3	1	2
CO3	2	3	2	2			2	2	3	2	3	2	2
CO4	2	3	2	3			3	2	2	2	3	1	2
CO5	2	2	3	2			2	3	3	3	3	2	2

Unit I : Foundations of Technical Communication:

Core Content: Technical communication vs. general communication: precision, objectivity, and audience-awareness. Types of technical documents: reports, proposals, manuals, specifications, abstracts. Writing process for technical documents: planning, drafting, revising, proofreading.

Audience analysis: primary and secondary audiences; adapting tone and technicality. Language in technical writing: active vs. passive voice, nominalisations, clarity and conciseness.

AI Integration: Analyse a technical paragraph for passive voice overuse and nominalisation, Hemingway Editor – paste a technical section and improve readability score to Grade 10 or below, Compare two versions of a technical document (before and after AI editing) and document changes

Free/Open-Source AI Tools: Grammarly (free); Hemingway Editor (free online); ChatGPT / Gemini (free tiers)

Unit II: Technical Report Writing:

Core Content: Structure of a formal report: title page, abstract, table of contents, introduction, methodology, results, discussion, conclusion, references, appendices. Abstract writing: informative vs. descriptive abstracts; 150-250 word limit. Literature review: searching, evaluating, and synthesising sources. Data presentation: tables, figures, charts — placement, numbering, and captioning. Citation and referencing: IEEE, APA, and MLA styles; avoiding plagiarism.

AI Integration: AI-powered literature search; find and summarise 5 relevant papers, manage citations and auto-generate bibliographies, generate a first-draft abstract; critique and rewrite to meet technical writing standards, Use Turnitin (institutional access) or Copyleaks (free tier) to verify originality

Free/Open-Source AI Tools: Elicit.org (free); Zotero (free, open-source); ChatGPT / Gemini (free tiers); Copyleaks (free tier) for plagiarism checking

Unit III: Research Proposals and Scientific Writing:

Core Content: Research proposal structure: background, problem statement, objectives, methodology, timeline, budget. Scientific paper format: IMRAD structure (Introduction, Methods, Results and Discussion). Writing results vs. discussion: factual reporting vs. interpretation. Peer review process: understanding blind review, revision, and resubmission. Conference papers vs. journal articles: scope, length, and submission guidelines.

AI Integration: Search for open-access papers in your domain; analyse IMRAD structure, get AI feedback on scientific language in a draft methods section, write a 1-page research proposal for a small project; use AI for structural review and language polishing

Free/Open-Source AI Tools: Semantic Scholar (free); Writefull (free); ChatGPT / Gemini (free tiers); Google Scholar (free)

Unit IV: Intellectual Property Rights – Fundamentals:

Core Content: Introduction to IPR: definition, importance, and types — patents, trademarks, copyrights, trade secrets, geographical indications. Patent system in India: Indian Patent Act 1970, Patent Office, patent application process. Patentability criteria: novelty, inventive step (non-obviousness), industrial applicability. Patent search: prior art search using databases. Copyright in engineering: software copyright, open-source licenses (GPL, MIT, Apache).

AI Integration: Conduct a prior art search on a given invention idea, search and analyse patent documents, identify 3 patents related to a chosen engineering domain and analyse their claims section, how does AI help in patent drafting?
Free/Open-Source AI Tools: Google Patents (free); Lens.org (free); ChatGPT / Gemini for patent language explanation (free tiers)

Unit V: Patent Drafting and IP Strategy:
Core Content: Structure of a patent application: title, abstract, background, summary, detailed description, claims, drawings. Types of claims: independent and dependent claims; method, product, system claims. Filing a Provisional Patent Application (PPA) in India. IP strategy for startups and engineers: trade secrets vs. patents, licensing, technology transfer. Case studies: famous patent disputes (Apple vs. Samsung, Monsanto seed patents, pharmaceutical patents).
AI Integration: Draft a set of patent claims for a simple mechanical invention; critique for clarity and scope, IP India Online Portal (ipindia.gov.in) – navigate and understand the e-filing system, write a complete patent disclosure document for a project-based invention idea, use AI to convert a project report executive summary into a patent abstract; compare the two
Free/Open-Source AI Tools: Google Patents (free); Lens.org (free); IP India Online Portal (ipindia.gov.in — free); ChatGPT / Gemini (free tiers)
